

PROFESSIONAL SUMMARY

Data Analyst with 5+ years of experience supporting enterprise data transformation, data integration, and analytics initiatives within financial services. Experienced in data lineage, data profiling, source-to-target mapping, requirements analysis, cloud data platforms, data quality, and stakeholder collaboration. Skilled at translating business needs into scalable data solutions, documenting business and functional requirements, supporting UAT and QA, and partnering with architects, data engineers, product owners, and business teams across Agile delivery environments.

SKILLS

Programming Languages: Python, SQL (SQL Server, PostgreSQL, MySQL)

Cloud Data Platforms: Snowflake, Databricks, AWS (S3, Glue, Redshift, RDS), Azure

Data Transformation & Integration: Data Lineage, Data Profiling, Data Mapping, Source-to-Target Mapping, ETL, Apache Airflow, Talend, Informatica

Business Analysis & Reporting: Business Requirements, Functional Requirements, Technical Requirements, User Stories, Acceptance Criteria, Process Flows, Power BI, Tableau, Microsoft Excel

Databases: SQL Server, PostgreSQL, MySQL, MongoDB

Data Architecture & Governance: Enterprise Data Architecture, Data Governance, Metadata Management, Data Quality, Entity-Based Models, Event-Driven Data, Data Validation

Testing & Delivery: UAT, QA Validation, Defect Management, Agile, Scrum, SDLC, Waterfall

Domain Knowledge: Financial Services, Payment Processing, Enterprise Data Modernization, Legacy System Transformation, Cloud Data Ingestion, Business Process Analysis

Tools & Platforms: Jira, Azure DevOps, Git, Jenkins, Microsoft Copilot, ChatGPT, Claude, Visual Studio Code

Analytics Libraries: Pandas, NumPy, Matplotlib, Scikit-Learn, SciPy

PROFESSIONAL EXPERIENCE

Fiserv, Alpharetta, GA | Data Analyst

Aug 2022 – Present

- Performed data lineage analysis across SQL Server, Snowflake, AWS, and downstream reporting layers to document source systems, transformation logic, data dependencies, and business usage.
- Conducted data profiling on high-volume financial transaction datasets to identify nulls, duplicates, format inconsistencies, referential integrity issues, and data quality gaps before downstream consumption.
- Developed and maintained source-to-target mapping documents for data moving from legacy financial applications into Snowflake and AWS-based analytical environments.
- Partnered with business stakeholders, product owners, architects, and data engineers to gather and document business, functional, and technical requirements for enterprise data transformation initiatives.
- Created user stories, acceptance criteria, business process flows, data definitions, and functional specifications in Jira to support Agile sprint planning and development execution.
- Analyzed legacy data assets and business rules to identify transformation opportunities, data gaps, and remediation needs for modern cloud-based target architectures.
- Validated AWS Glue and Snowflake ingestion outputs by reconciling source and target record counts, key financial measures, field-level transformations, and exception records.

- Coordinated UAT, QA validation, defect triage, and business sign-off activities, ensuring transformed datasets met documented requirements and enterprise quality standards.
- Built Power BI dashboards and executive scorecards for transaction volume, authorization rates, chargeback ratios, and revenue performance, improving visibility into operational and data-quality trends.
- Supported enterprise data governance by maintaining metadata, business definitions, mapping documentation, lineage artifacts, and standardized data-quality rules.
- Facilitated stakeholder meetings, documented decisions and action items, managed expectations, and communicated project risks, dependencies, and delivery progress to technical and business teams.
- Used Microsoft Copilot, ChatGPT, and other AI-assisted productivity tools to accelerate requirements documentation, SQL analysis, meeting summaries, and test-case preparation while applying appropriate review controls.

Tata Capital, Hyderabad, India | Data Analyst

Jan 2020 – June 2021

- Analyzed financial lending and customer datasets to understand source structures, business rules, reporting dependencies, and transformation requirements for analytics initiatives.
- Performed data profiling and anomaly analysis across multiple source datasets, reducing data-related errors by 20% and improving reliability of downstream reporting outputs.
- Created data mapping documents and transformation specifications for integrating legacy data sources into Databricks-based processing and reporting environments.
- Worked with business users to gather reporting requirements, clarify data definitions, document process flows, and translate business needs into technical tasks for development teams.
- Designed and implemented ETL workflows in Databricks to integrate data from multiple systems and deliver standardized datasets for operational and executive reporting.
- Developed interactive Power BI dashboards that improved executive understanding of business trends by 20% and enabled non-technical stakeholders to monitor key performance indicators.
- Supported source-to-target validation by comparing record counts, financial totals, field formats, and transformation outcomes across development, QA, and production environments.
- Participated in QA and UAT activities, documented defects, coordinated issue resolution, and verified that reporting solutions satisfied agreed business requirements.
- Maintained data dictionaries, report specifications, transformation logic, and data-quality documentation to support governance and consistent interpretation of business data.
- Followed structured SDLC and Waterfall delivery practices, tracking milestones, dependencies, risks, and deliverables for data integration and reporting projects.

EDUCATION

Master of Science in Computer Engineering

University of New Haven

CERTIFICATION

AWS Certified Data Analytics
