## Core Skills

**Languages:** Java, C/C++, C#, SQL, HTML/CSS, JavaScript, Typescript, Rust, Groovy, Python

**Frameworks/Tools:** MongoDB, .NET, React, PowerShell, Node.JS, Qt, SpringBoot, Angular, Playwright, Microsoft Office Suite (Word/Excel), Junit, MySQL

**DevOps/Systems:** API Development & Integration, Agile Software Development, Linux/Unix Environment Development, Git, Incident Triaging, Docker, User Acceptance Testing, CI/CD Pipeline Management, Automated Testing, Jira, Atlassian, ServiceNow

## Work Experience

### Software Engineer

November 2021 - June 2025

*Digitate*

- Delivered full software development life cycle (SDLC) projects from requirements gathering through deployment, ensuring all deliverables met performance, scalability, and security standards
- Developed and integrated RESTful APIs for seamless cross-system communication, validating and troubleshooting with Postman to maintain reliability and optimize performance.
- Participated in the full lifecycle of software design and development, from concept to deployment and maintenance.
- Integrated Hornbill CMDB to Ignio for continuous config item tracking and asset management.
- Deployed custom Hornbill ITSM connectors to automate incident and service request lifecycles, reducing manual intervention and improving resolution times **by more than 15%**.
- Gathered and documented software requirements for new features and enhancements.
- Modernized the AppDynamics Monitoring adapter by refactoring legacy code, improving performance **by over 30%**, maintainability, and cross-platform compatibility.
- Applied automation through PowerShell scripting to optimize routine administrative functions, reducing manual workload by **up to 25%** and improving system operations.
- Leveraged CI/CD pipelines and DevOps best practices to plan, automate, and execute deployments with speed and precision, ensuring consistent, low-risk releases that minimized downtime and maintained service continuity.

- Collaborated with senior engineers to troubleshoot and resolve issues within software as a service (SaaS) environments, improving system performance.
- Utilized version control and collaborative development in software engineering projects.
- Implemented rigorous quality assurance testing procedures to identify and resolve issues.
- Managed API version control and orchestrated coordinated release cycles while implementing strategies to ensure disruption-free transitions during system upgrades.
- Diagnosed and resolved software issues through advanced debugging techniques and root cause analysis, improving system stability and reliability **by at least 10%**.
- Leveraged Object-Oriented Development for efficient code organization and maintainability.
- Demonstrated a strong will to learn new technologies and programming languages to enhance software development capabilities.

## Projects

### [Qt GUI Demo](#)

September 3, 2025 – September 4, 2025

I developed a Qt GUI app with 20+ interactive tabs to teach C++ and Qt concepts, featuring class-based architecture, live demos, and cross-platform build support.

- 20+ interactive tabs for hands-on C++ and Qt learning.
- Real-time demos: create objects, run code, and see instant UI updates.
- Modular, class-based design for easy extension and reuse.

### [Job Application Tracker](#)

August 29, 2025 – September 1, 2025

I built a web app to track and manage job applications, with user authentication, job management, and a dashboard for monitoring application status.

- Built a Node.js/Express backend with MongoDB to track job applications in a structured way.
- Set up endpoints to create, read, update, and delete (CRUD) application data using Mongoose.
- Organized the project into a clean monorepo, making it easier to grow into a full-stack app with React.

## Education

### Florida Atlantic University

**Bachelor of Science** Computer Science
