PROFESSIONAL SUMMARY

Backend & DevOps Engineer with 2+ years of experience in two roles, building and owning systems end-to-end with Python REST integration, CI/CD automation with Jenkins and Ansible, and containerized deployments with Docker. Comfortable owning a build solo, from reading the docs to standing up the service. Strong in SQL and data integration; focused on reliable, automated backend systems.

TECHNICAL SKILLS

Core: Python, Golang, SQL, Bash, Docker, Jenkins, Ansible, REST API, PostgreSQL, Git/GitHub, Bitbucket, Linux.

Familiar: Java, JavaScript/TypeScript (Node.js, Express.js), Terraform, MySQL, MongoDB, AWS (S3, EC2, Cognito), Azure (ARO, API Management), OAuth2, JWT.

Certifications: Scrum Master (CSM), Government of Canada Reliability Status

EDUCATION

Honours Bachelor of Technology - Software Development
Seneca College | GPA: 3.7

September 2019–December 2023
North York, ON, Canada

WORK EXPERIENCE

Software Developer | Actemium Summa Engineering | January 2024–August 2025 | Mississauga, ON

- **Built a Python integration** connecting cloud-based municipal sensors (water pressure and overflow) to the Historian monitoring system. The company had never worked with cloud data or REST APIs before.
- Transformed sensor JSON into the Historian required schema by mapping every tag and column from documentation, then pushed data in over **REST APIs**.
- Designed the integration as a **decoupled, fault-tolerant pipeline**: buffered readings in a queue when the downstream was unavailable and replayed them in order on recovery, so no data was lost.
- **Automated collection with scheduled cron jobs**, reducing manual intervention by 95%.
- Implemented JWT tokens and SSL certificates for secure handling of sensitive data; built optimized custom SQL reporting on the Ignition platform.

DevOps Engineer - Intern | Employment & Social Development Canada | January 2023–December 2023 | Toronto, ON

- Built an **Ansible playbook triggered by a Jenkins pipeline** that collects environment specs and auto-publishes them into a Confluence page, replacing a manual audit that went stale immediately.
- Authenticated into each environment using **bearer tokens** secured with **Ansible Vault** and pushed inventory into a Confluence page via its REST API.
- Assisted in cloud database infrastructure setup using Terraform and Ansible, enhancing configuration management.
- Improved CI/CD pipelines through caching, parallelization, and pipeline cleanup, increasing deployment speed by 30%.
- Configured API-Curio in an Azure Red Hat OpenShift (ARO) environment; monitored and resolved production issues via its log analysis, reducing downtime incidents by 10%.

TECHNICAL PROJECTS

Ario Teams Chatbot | June 2025–November 2025

- AI-powered chatbot using Azure OpenAI GPT models with a **Retrieval-Augmented Generation (RAG)** pipeline for grounding on company data.
- Built a **FastAPI backend** for authentication, query routing, and context management; deployed into Microsoft Teams via Teams Toolkit.

My Doctor's Application (Capstone) | May 2021–January 2023

- Built a health web app with online booking and self-assessment (**AngularJS frontend; Node.js/TypeScript/MongoDB backend, JWT auth**).
- Containerized with Docker, set up CI/CD, and reduced deployment time by 50%.

Fragments Microservice | January 2021–August 2021

- Scalable microservice on **AWS (S3, EC2, ECR)** with Docker; secure authentication via AWS Cognito, JWT, and IAM roles.
