EDUCATION

NYU Center for Data Science - College of Arts & Science

Aug 2022 - May 2025

B.A. in Computer Science and Data Science

- GPA: 3.8
 - Relevant Coursework: Probability and Statistics, Causal Inference, Data Analysis and Management, Predictive Analytics, Fundamentals of Machine Learning, Advanced Topics in ML and Deep Learning, Artificial Intelligence
 - Clubs: Women in Data Science, Tech@NYU, Girls Who Code, Study Abroad (London)
-

RELEVANT WORK EXPERIENCE

Research and Performance Analyst - Intern

May 2024 – Aug 2024

Sharecare

- Evaluated campaign performance by analyzing data trends and key performance indicators, delivering actionable insights to stakeholders.
 - Partnered with data scientists to develop predictive models using XGBoost, forecasting campaign reach and effectiveness.
 - Maintained and presented interactive dashboards to visualize campaign metrics and progress for cross-functional teams.
 - Organized and facilitated biweekly meetings with diverse teams to discuss research findings and performance outcomes.
 - Revamped the company database, enhancing data accuracy, user experience, and operational efficiency.
 - Supported ROI analysis and created compelling slide presentations to communicate research results to executive leadership.
-

PROJECTS

Machine Learning-Based Movie Recommendation System

- Developed a regularized matrix factorization algorithm with stochastic gradient descent, reducing RMSE through advanced hyperparameter tuning.
- Built a deep neural network recommender in TensorFlow/Keras, utilizing 64-dimensional embeddings and ReLU-activated dense layers, Adam optimization and 10-fold cross-validation.
- Processed and analyzed over 100,000 user-movie interactions with pandas and NumPy; visualized rating distributions and genre trends using matplotlib and seaborn to inform feature engineering.

Disaster Damage Classification with Conditional GANs and VGG Networks

- Designed and trained a conditional GAN and VGG-based classifier for disaster type prediction from satellite imagery using PyTorch.
- Implemented auxiliary classification, reconstruction loss, and building-level data augmentation to improve model accuracy and dataset balance.
- Conducted model training, hyperparameter tuning, and evaluation on HPC clusters.

Spotify Data Analysis

- Analyzed a dataset of 52,000 Spotify songs to determine key factors influencing track popularity, such as duration, explicitness, and musical key.
 - Performed comprehensive data cleaning, transformation, and normalization to ensure reliable analysis.
 - Built and assessed predictive models (linear, multiple, and logistic regression) using features like danceability, energy, and loudness to forecast song popularity.
 - Applied Principal Component Analysis (PCA) to reduce dimensionality and enhance model interpretability.
-

SKILLS

- **Programming:** Python, SQL, Java, C++
- **Machine Learning:** SVM, Neural Networks, Clustering (Hierarchical, DBSCAN, KNN), Random Forest, Naive Bayes
- **Data Tools:** Pandas, NumPy, Scikit-learn, PyTorch, Hadoop, Slurm, Tableau, PowerBI
- **Methods:** Monte Carlo simulation, Significance testing, A/B testing
