

MAMAN FATHIM KAMAGATE

DATA ANALYST | HEALTHCARE ANALYTICS | BUSINESS INTELLIGENCE (BI) | SQL & DASHBOARDS

Houston, TX | ftkhamg@gmail.com | +1 936-900-2049

PROFESSIONAL SUMMARY

Healthcare Data Analyst with **8+ years of experience** supporting provider and payer organizations through **SQL-driven analysis, KPI reporting, dashboard development, and data quality governance**. Skilled at translating operational, clinical, and financial data into insights that improve **utilization, readmissions, length of stay (LOS), revenue-cycle performance, and quality outcomes**. Known for strong stakeholder partnership, clear documentation, and disciplined handling of sensitive data in **HIPAA/PHI** environments. Comfortable working across data lifecycle work—**requirements, extraction, validation, reporting, insight delivery**—in fast-paced, cross-functional settings.

TECHNICAL SKILLS

Analytics & Querying: SQL (joins, CTEs, window functions), Data Profiling, Data Validation/Reconciliation, Root Cause Analysis, Trend/Variance Analysis

BI & Reporting: Power BI (DAX, Power Query), Tableau, Executive Dashboards, KPI Scorecards, Self-Service Reporting

Spreadsheets: Advanced Excel (Power Pivot, PivotTables, Power Query, Lookups, Modeling)

Automation & Scripting: Python (pandas; reporting automation), Basic Statistics, Forecasting Support

Data Platforms (common in-market): Enterprise Data Warehouse (EDW), Data Marts, ETL/ELT validation, Data Catalog / Data Dictionary practices

Healthcare Domain: Claims & Eligibility, EHR/Encounter concepts, Utilization Management, Population Health support, Quality Measures (working knowledge of **HEDIS/NCQA**, CMS-aligned reporting), ICD-10/CPT familiarity (reporting context)

Compliance & Governance: HIPAA, PHI handling, Access Controls, Audit Support, Data Governance documentation

Collaboration: JIRA/Confluence, SharePoint, Requirements Gathering, Stakeholder Presentations, SOPs/Runbooks

PROFESSIONAL EXPERIENCE

Data Analyst — CareSource

Jan 2023 – Present | Remote/Hybrid

- Own end-to-end analytics for payer-side reporting by translating business questions into **well-defined metrics, query logic, and refreshable dashboards**, ensuring leaders can track cost, quality, and utilization with minimal manual effort.
- Develop and maintain **Power BI KPI scorecards** (executive-friendly and drill-down views) to monitor key performance indicators such as utilization patterns, high-cost drivers, provider performance signals, and member trend shifts across time periods and segments.
- Write and optimize **complex SQL** to extract, join, and validate large datasets (claims, eligibility, provider, authorization/utilization), applying consistent business rules and reconciling totals against source reports to prevent downstream reporting discrepancies.
- Perform **data quality controls** (completeness checks, duplicate detection, outlier review, variance thresholds, and cross-system reconciliation) and document findings to improve trust in dashboards used for operational and regulatory-facing decisions.
- Support cross-functional stakeholders (care management, quality, finance, and operations) by delivering **actionable analysis** that identifies where performance is drifting, what populations are driving changes, and which operational levers can improve outcomes.
- Build reusable reporting components (filters, standardized measures, data definitions) to support **self-service analytics**, reducing repeat ad-hoc requests and improving consistency across teams consuming the same KPI.
- Contribute to governance by maintaining **metric definitions, calculation notes, and data dictionaries**, enabling audit-ready reporting and reducing confusion when multiple teams interpret the same measure differently.
- Partner with engineering/IT to resolve data issues by providing **clear defect descriptions** (expected vs. actual results, query evidence, sample records), accelerating root-cause isolation and remediation.
- Ensure strict compliance with **HIPAA/PHI** requirements by applying least-privilege practices, avoiding unnecessary exposure of sensitive elements, and using secure sharing methods for reporting artifacts.

Senior Data Analyst — Encompass Health

Jul 2020 – Dec 2022 | Houston, TX

- Supported inpatient rehabilitation performance analytics by producing **operational and outcomes reporting** for leadership, connecting throughput, census, and discharge patterns to facility-level decisions.
- Built and managed **Power BI/Excel dashboards** used by hospital administrators and clinical leaders to track LOS, readmission-related indicators, patient flow, and service-line performance; improved visibility through consistent definitions and drill-through views.
- Conducted **weekly/monthly variance analysis** comparing actuals vs. targets, identifying performance drivers (seasonality, staffing patterns, referral mix) and translating findings into concise recommendations for operational planning.
- Extracted data using **SQL** from clinical/operational sources and validated accuracy through record-level sampling, reconciliations, and exception reporting to reduce avoidable reporting errors and rework.
- Standardized recurring reporting by creating repeatable templates, structured queries, and refresh procedures; reduced manual spreadsheet handling and improved report turnaround under tight leadership timelines.

- Supported quality initiatives by aligning reporting with program needs and ensuring consistent metric logic across teams; maintained documentation to improve continuity during process changes or leadership requests.
- Collaborated with clinical, finance, and operations stakeholders to clarify requirements and ensure deliverables reflected real operational workflows—minimizing “nice-to-have” noise and focusing on metrics that drive decisions.
- Improved issue resolution speed by maintaining a “single source of truth” for key KPIs and documenting assumptions, exclusions, and calculation methods for shared understanding across departments.
- Protected sensitive information by applying **HIPAA-aware reporting practices**, limiting PHI to need-to-know use cases and ensuring secure handling and distribution.

Data Analyst — Ardent Health Services

Mar 2019 – Jun 2020 | Nashville, TN

- Delivered enterprise reporting across hospital operations by transforming stakeholder needs into **clear KPIs, dashboards, and recurring reports** supporting patient flow, utilization, and performance management.
- Created and maintained dashboard views for leadership that tracked operational indicators (bed utilization, throughput bottlenecks, readmission-related signals, revenue-cycle touchpoints), enabling faster identification of trending issues.
- Performed **root-cause and exception analysis** when metrics shifted unexpectedly, tracing changes back to workflow adjustments, data feed issues, or definition drift; documented findings with supporting query evidence.
- Executed SQL-based extraction and analysis from enterprise repositories, applying strong data hygiene: field-level validation, duplicate resolution, standardized filters, and consistent time-window logic.
- Supported platform/reporting changes by validating outputs pre- and post-change, ensuring continuity in KPI definitions and reducing disruption to executive reporting cycles.
- Built documentation artifacts (report specs, calculation notes, refresh instructions) to improve operational resilience and reduce knowledge dependency on individual analysts.
- Worked closely with IT/analytics teams to log and track reporting defects, providing reproducible steps and record samples to shorten investigation cycles.
- Assisted with governance activities by maintaining consistent metric definitions and supporting compliance-aware reporting practices within healthcare data handling standards.
- Improved stakeholder adoption by simplifying dashboards, adding interpretive labels, and aligning visualizations to real decision points rather than “data for data’s sake.”

Junior Data Analyst — LifePoint Health

Mar 2018 – Feb 2019 | Brentwood, TN

- Supported senior analytics staff by preparing **clean, validated datasets** for reporting and analysis, ensuring leaders received consistent performance views across facilities and reporting periods.
- Wrote foundational SQL queries to extract operational and performance data, applying filters and joins with attention to data integrity and repeatability for recurring reporting needs.
- Produced Excel-based reporting packs with pivots, models, and trend visuals; ensured refresh steps and calculation logic were consistent to minimize errors under tight reporting deadlines.
- Assisted with data reconciliation by comparing source totals and report totals, investigating mismatches through targeted query checks and documenting corrective steps for repeat issues.
- Participated in requirements discussions to understand how teams used metrics in real workflows; translated feedback into report updates that improved clarity and usability.
- Helped maintain reporting documentation (metric definitions, refresh procedures, data notes), strengthening team continuity and reducing dependency on tribal knowledge.
- Supported ad-hoc requests by rapidly turning around analyses with clear assumptions and defensible calculations—prioritizing accuracy and alignment with stakeholder intent.
- Followed strict **HIPAA/PHI** handling practices, limiting access and ensuring secure storage/sharing methods for any sensitive reporting elements.
- Built strong foundational skills in healthcare operations reporting, stakeholder communication, and disciplined QA checks that supported scalable analytics work in later roles.

EDUCATION

Master of Public Health (MPH) — University of Texas Health Science Center at Houston, USA | 2013

Bachelor of Science (BS), Health Studies (Cum Laude) — Texas Woman’s University, USA | 2011
