

PROFILE SUMMARY:

- 5 years of extensive IT experience as a **Full Stack Developer**, specializing in **Python, Java (J2EE)**, and modern **web technologies**, with strong expertise in **automation, RESTful services**, and **scalable software architecture**.
- End-to-end experience in designing, developing, testing, deploying, and maintaining **enterprise-grade applications** using **Flask, Spring Boot, Django, Java Servlets**, and **Node.js**.
- Proficient in building robust front-end applications using **React.js, Angular, Next.js, JavaScript, HTML5**, and **CSS3**, creating responsive and dynamic user interfaces aligned with modern UI/UX principles.
- Solid command of **Core Java, Object-Oriented Programming**, and **OOAD principles**; applied design patterns like **DAO, Singleton**, and **Session Façade** to ensure modular and maintainable architectures.
- Implemented **RESTful web services** and integrated frontend-backend systems seamlessly, enabling high-performance, scalable APIs for data-driven applications.
- Automated critical university operations including **I20 document processing, student registration systems**, and **email parsing workflows** using **Python, Node.js, Selenium**, and **TypeScript**, reducing manual effort by over 60%.
- Built Python-based **chatbots** and automated **ticket triaging systems**, enhancing productivity and helpdesk efficiency by integrating with platforms like **Mattermost** and **ServiceNow**.
- Developed global tools and monitoring dashboards to manage 1000+ **ETL jobs**, automate **MongoDB backup/restore**, and improve **Big Data** workflows with **HDFS** and **MapReduce**.
- Extensive experience with **database design** and **query optimization** using **PostgreSQL, MongoDB, Oracle**, and **DB2**, along with real-time report generation and backup automation via scripting.
- Skilled in **CI/CD practices** using **Jenkins, Git**, and **GitHub**, managing release pipelines, code merges, and collaborative development with clean commit histories.
- Deployed **Dynatrace** and **Splunk** across multiple servers for proactive monitoring and faster issue resolution, contributing to improved uptime and reduced incident response times.
- Earned multiple accolades including *Star of the Quarter* and *On-the-Spot Awards* for driving key automation initiatives, enhancing system reliability, and consistently delivering high-quality solutions.

SKILLS:

Category	Skills/Technologies
Programming Languages	Python, Java, C++, JavaScript, HTML/CSS, SQL
Frameworks & Libraries	Flask, Django, Spring Boot, React.js, Next.js
Web Services	RESTful APIs, Microservices
Cloud Platforms and CI/CD	AWS, Jenkins, Git, GitHub, Kubernetes, Docker
Databases	Postgres SQL, MongoDB, DB2, cassandra, Oracle, Dynamo DB

Monitoring & Logging	Dynatrace, Splunk, Grafana
Developer Tools	VS Code, Eclipse, Pycharm, Postman
Testing & QA	JUnit, Mockito, Cypress, Selenium, Test-Driven Development (TDD), Behavior-Driven Development (BDD)
Messaging Systems	Kafka, RabbitMQ, AWS SQS, SNS

PROFESSIONAL EXPERIENCE:

Software Development Engineer I

Arnex Solutions – July 2024 – Present | Remote, USA

Overview:

Contributed to the development of a full-featured restaurant management platform using the MEAN stack, focused on improving digital workflows for order handling, kiosk/table-based login, and role-based access. Designed authentication flows, enhanced UI/UX for kiosk/table experiences, and implemented secure session management using Capacitor and OTP-based login systems. Ensured scalability and maintainability of backend logic through modular API design and real-time data management.

Tech Stack:

Angular, HTML5, SCSS, JavaScript, Node.js, Express.js, MongoDB, OTP-based login, Capacitor Storage, MEAN stack, RESTful APIs, Modular API Design, Git, GitHub, VS Code, Postman, MongoDB Compass, Environment-based config, Real-time user session management

Key Contributions:

- Developed and deployed a **MEAN stack** restaurant management system with **Angular** for a responsive frontend, **Node.js + Express** for backend APIs, and **MongoDB** for schema-flexible data persistence.
- Implemented a **secure OTP-based login system** using **Capacitor Storage**, enabling **role-based access control** for tables and kiosks, ensuring secure and isolated login flows for various restaurant users.
- Built a **real-time activation code generator and table management tool**, allowing restaurant managers to dynamically create and store OTPs in MongoDB for smooth table login and session tracking.
- Integrated dynamic routing and role redirection for **kiosk/table UIs**, improving user navigation based on assigned roles (e.g., waiter, cashier, admin).
- Ensured mobile and tablet responsiveness across components, enhancing UX for on-premises kiosk/tablet logins.
- Enhanced code reusability and scalability through modular **API architecture**, version-controlled Git workflows, and environment-based deployment strategies.

Graduate Assistant | Enrollment Operations

University of New Haven — Feb 2023 – May 2024

Overview:

The Enrollment Automation project focused on streamlining and digitizing manual academic and immigration workflows for international students. Key initiatives included automating I20 document processing, GPA

calculations, and student registration systems. Additionally, intelligent chatbots were developed to support the university's immigration and advising teams, providing students with real-time updates and information

Tech Stack:

Python, Flask, Node.js, TypeScript, HTML, CSS, JavaScript, Selenium, PostgreSQL, MongoDB, Git, RESTful APIs, Linux, Excel Automation

Key Contributions:

- Developed a web-based GPA calculator using Python, HTML, and CSS, eliminating reliance on third-party or paid tools.
- Automated I20 uploads to student accounts using Python, TypeScript, and Node.js, reducing manual workload by 50–60 hours per week.
- Created a Flask-based automation system for class registration, saving approximately 30 days of manual processing time.
- Built a Python-Selenium tool for generating I20 documents automatically, drastically reducing processing time and human error.
- Designed and implemented intelligent chatbots for the university's immigration team, streamlining responses to common visa, OPT, and CPT queries from international students.
- Integrated chatbots with student portals, enabling real-time information delivery on I20 status, SEVIS updates, and document checklists.
- Collaborated closely with the Office of International Services (OIS) to gather use cases and train chatbot flows using natural language intents, improving response accuracy and student satisfaction.
- Ensured compliance with immigration policies and FERPA regulations while handling sensitive student information through automation workflows.
- Conducted testing and debugging of automated systems across staging and production environments on Linux servers.

Software Engineer – Healthcare Domain

Tata Consultancy Services (TCS) – 04/2019 – 08/2022 | Hyderabad, India

Overview:

Worked on critical automation initiatives in the healthcare domain, supporting over 30 enterprise-grade applications and optimizing workflows for development, monitoring, and support. Designed and implemented AI-powered chatbots to streamline interactions for internal helpdesk and immigration support teams. Developed large-scale automation tools and analytics dashboards for operational efficiency, integrating LLM capabilities to enhance chatbot responses and ticket routing intelligence.

Tech Stack:

Python, java, Mattermost API, OpenAI/GPT APIs, LLM integration, Node.js, Shell Scripting, MongoDB, PostgreSQL, Jenkins, Git, Blue Prism, ServiceNow, Hadoop (HDFS, MapReduce), Splunk, Dynatrace, RESTful APIs, CI/CD, Flask, React.js, SQL, JSON, Cron Jobs, Agile, Jira

Key Contributions:

- Developed **Python and Java-based intelligent chatbots** integrated with **Mattermost**, automating helpdesk and immigration workflows and improving efficiency by 40%.
- Integrated **GPT-powered LLMs** into chatbots and ticketing systems for natural language understanding, enabling context-aware automation and reducing triage time by 50%.
- Built backend services using **Java (Spring Boot)** and **Flask**, creating secure, high-performance RESTful APIs for internal tools and reporting services.
- Designed responsive UIs using **React.js** and **Angular**, enabling real-time dashboards, health check views, and admin portals for IT operations.

- Created global reporting tools using **Python + Flask**, automating database queries and enabling live data access across platforms.
- Automated **MongoDB** backup/restore processes with Shell scripting, achieving 30% fewer manual errors and a 20% efficiency gain.
- Managed **1000+ ETL jobs**, reduced SLA breaches, and stabilized job failures through active issue resolution and collaboration with DB teams.
- Deployed **Dynatrace** across 22+ servers for proactive monitoring and integrated **Splunk** and **Grafana** for log analysis and real-time visualizations.
- Containerized applications using **Docker**, deployed them on **Kubernetes**, and implemented CI/CD with **Jenkins** and **GitHub**.
- Worked with distributed systems and messaging queues using **Kafka**, **RabbitMQ**, **AWS SQS**, and **SNS**, enabling scalable asynchronous communication.
- Practiced agile development using **VS Code**, **Eclipse**, **PyCharm**, and **Postman**, ensuring clean commit histories, testing, and rapid delivery.
- Implemented test automation using **JUnit**, **Mockito**, **Selenium**, and **Cypress**, with a strong emphasis on **TDD/BDD** practices.

Founder & Developer – NutriSnap App

Personal Project – January 2025 – Present

Overview:

Built **NutriSnap**, a cross-platform mobile app using **Flutter** and **Django**, designed to detect food items from images and provide users with nutrition breakdowns and personalized goals. Leveraging computer vision and machine learning (CLIP and Food-101), the app combines food recognition with nutrition tracking, goal setting, and daily progress analytics—all within a visually engaging UI/UX tailored for mobile.

Tech Stack:

Mobile Frontend: Flutter, Dart, Provider, Animated UI, Capacitor

Backend: Django, Django REST Framework, Djoser, PostgreSQL

ML/AI: PyTorch, EfficientNet-B0, CLIP, Food-101 Dataset

Auth & Storage: Token-based Auth, Djoser, Capacitor Storage

Features: Nutrition goals, food detection, OTP reset, profile management

Tools: VS Code, GitHub, Postman, Android Studio, Dice Bear API

Deployment: Dockerized Django API, Flutter for Android/iOS builds

Key Features:

- Developed **Flutter mobile UI** for Android/iOS, supporting camera-based image uploads and manual food entry options.
- Integrated a **Django backend** with custom endpoints for food classification, calorie tracking, goal setting, and user profile management.
- Trained a **custom EfficientNet-B0 model** on the Food-101 dataset to classify food items and return confidence-based predictions with fallback CLIP-based matching.
- Implemented a secure **Djoser-based user auth system** with support for login, registration, OTP password reset, and token-based authentication.
- Built **goal tracking screens** for nutrients (calories, fat, carbs, protein) using Flutter + Provider for state management and progress rings for visualization.
- Designed reminder features for nutrient consumption timing and daily tracking dashboard with animated health rings.

- Enabled **DiceBear avatar integration**, secure user data storage, and exportable nutrition history.
- Integrated **Capacitor Storage** and **SQLite** for offline access and persistent login sessions.
