

Lasya Naga Sai Priya Bolem

Atlanta, GA | lasyabolem25@gmail.com | (678)-690-0980 | www.linkedin.com/in/lasya-priya-675034257

Professional Summary

Analytical and results-driven Data Analyst with 2.5+ years of hands-on experience building real-time data pipelines, developing cloud-based data warehouses, and delivering actionable business insights through interactive dashboards. Proven ability to leverage tools like Snowflake, AWS, Kafka, and Spark to transform raw data into strategic intelligence. Adept at using Python, SQL, and data visualization platforms such as Tableau and Power BI to support cross-functional teams in making informed decisions. Passionate about translating complex datasets into clear, impactful narratives that drive business growth. .

Technologies

Programming & Scripting: Python (Pandas, NumPy, Scikit-learn, TensorFlow, PyTorch), SQL, Java, PySpark
Data Engineering & ETL: Apache Spark, Kafka, Apache Airflow, Snowflake, AWS (S3, Lambda, Glue), Data Warehousing, ETL Pipelines, JSON CSV Parsing
Cloud & Platforms: AWS Cloud Services, Microsoft Azure Snowflake Data Cloud, Git.
Visualization & BI Tools: Tableau, Power BI, Snowsight
Machine Learning & NLP: Sentiment Analysis, Text Classification, NLTK, Keras
Workflow & Collaboration: Jupyter, GitHub, Agile/Scrum methodologies.

Education

Kennesaw State University ,Master of Science in Information Technology Aug 2023 – May 2025

Experience

Research Assistant (Data Analysis, MIL focused) , Kennesaw State University May 2024 – May 2025

- Built a real-time Twitter data ingestion pipeline using Tweepy, Kafka, and Apache Spark: Streaming to collect and process over 1M+ tweets, enabling trend detection and social event monitoring
- Applied NLP techniques (tokenization, lemmatization, sentiment analysis) using NLTK and TextBlob to classify tweet sentiment and track public opinion shifts across key regions.
- Trained and optimized machine learning models (Random Forest, SVM, LSTM in Python, improving engagement prediction accuracy by 18% over baseline models.
- Designed scalable data repositories using AWS S3 and Snowflake, accelerating model training and supporting efficient querying of large-scale, processed datasets.
- Developed interactive dashboards in Power BI and Tableau to visualize trending topics, sentiment trends, and model insights, supporting data storytelling for academic and external stakeholders.
- Automated data workflows using Apache Airflow, streamlining daily ETL processes and reducing manual effort by 75%, ensuring consistency and reproducibility using Git and Jupyter Notebooks.

Data Analyst, Raiton Semiconductors; Client: IBM January 2022 – June 2023

- Conducted advanced analysis of large-scale customer and operational data stored in AWS S3, uncovering insights that improved product performance and user engagement across business units.
- Built optimized SQL queries and conducted EDA using Python (Pandas, NumPy) to support predictive modeling, A/B testing, and data-driven decisions.
- Designed and delivered interactive dashboards in Tableau and Power BI to visualize KPIs such as churn, customer satisfaction, and sales trends, enabling real-time executive insights.
- Collaborated with cross-functional IBM teams to translate business goals into analytical solutions, integrating internal KPIs with customer feedback data and contributing to a 12% boost in NPS.

Projects

Real-Time Twitter Sentiment Dashboard

- A real-time data pipeline that streamed live tweets using Tweepy, processed text using Spark Streaming, and stored the results in AWS S3. Applied sentiment analysis with NLT and visualized tweet polarity, volume, and trending topics in a Tableau dashboard. Enabled real-time insights into public opinion for specific keywords and events.

Retail Sales Forecasting and Inventory Optimization

- Built a machine learning model to forecast weekly sales and optimize stock levels across product categories for a retail dataset. Used time series forecasting and regression model for predicting demand patterns. Automated ETL processes using SQL and integrated the results into an interactive Power BI dashboard for inventory managers to make proactive stocking decisions.

Patient Risk Stratification Using Predictive Modeling

- Analyzed anonymized patient data to predict risk levels for chronic diseases using classification algorithms (Logistic Regression, Random Forest). Conducted extensive EDA and feature engineering to improve model accuracy. Presented findings via Power BI dashboard to illustrate patient segmentation and high-risk indicators for preventive healthcare planning.

Certifications

AWS Cloud Practitioner | Python for Everybody | Microsoft Azure for AI
