

Bhargav Narayana Anumalasetty

Jersey City, NJ | 413bharagav413@gmail.com | +1(551)-376-8865 | [Linkedin](#)

EDUCATION

Long Island University, Brooklyn

Master of Science in Data Analytics

Brooklyn, NY

May, 2026

JNTUK, ST. ANN'S College of Institution and Technology

Bachelor of Technology in Electronics and Communication Engineering

Chirala, India

January 2024

SKILLS AND CERTIFICATIONS

Technical Skills: SQL, Microsoft Office, Python, R.

Tools & Cloud Platforms: Tableau, Power BI, Looker Studio, Jupiter Notebook.

Statistics and ML: Hypothesis, Forecasting, Regression Analysis, Classification, Clustering, NLP.

Certifications: Python (IIT, Bombay); Microsoft Power BI.

WORK EXPERIENCE

AI-variant

Data Analytics

Bengaluru, India

September 2023-June 2024

• Resume Classification System:

Developed a machine learning-based system to automatically classify 1,000 resumes into meaningful categories such as **skills**, **skills with experience**, and **freshers**. Utilized **Natural Language Processing (NLP)** techniques for feature extraction, including unigrams, bigrams, **CountVectorizer**, and **TF-IDF**. Built and evaluated multiple classification models, including Decision Tree, Random Forest, SVM, XGBoost, Naive Bayes, and Voting Classifier, to identify the best-performing algorithm. The system streamlined candidate profiling, enabling faster, more accurate recruitment decisions.

• Bankruptcy Prediction System: Finance Analytics / Machine Learning Project

Built a predictive system to identify potential bankruptcies using historical financial data. Applied **regression models** and **classification algorithms**, including **Support Vector Machines (SVMs)**, **Naive Bayes**, **Decision Trees**, and **Random Forest Classifiers**. Enhanced model performance using **ensemble techniques** to improve prediction accuracy and reduce overfitting. The project aimed to support early risk detection for financial institutions and investors by analyzing key financial indicators and classifying companies based on their bankruptcy likelihood. **Executive Stakeholder Communication:** Presented insights to Sales & Marketing leaders via Tableau, highlighting strategies to improve marketing efficiency by 20% through focused acquisition and data-backed campaign strategies.

• Sentimental analysis on Tweets (Python, NLP)

- Conducted sentiment analysis on approximately **3,000 tweets** to extract emotional tone and public opinion trends. Used **emotion mining techniques** to classify tweets such as **joy**, **anger**, **sadness**, **fear**, and **surprise**. Applied **Natural Language Processing (NLP)** for text cleaning, tokenization, and feature extraction using methods like **TF-IDF** and **CountVectorizer**, and **Named Entity Recognition (NER)** to identify and extract key entities. Built and evaluated models using algorithms such as **Logistic Regression**, **SVM**, and **Naive Bayes** to determine sentiment polarity and emotional intensity. Attained 91% accuracy.

DATA ANALYTICS PROJECTS

Capstone Project – Multimodal AI Chatbot (Corona Toilets)

- Built an end-to-end **multimodal AI chatbot** answering domain-specific and general queries, performing calculations, and retrieving real-time data (e.g., weather).
- Implemented **YOLO-based computer vision** for toilet model recognition using **object detection (bounding boxes)** and **instance segmentation (polygon masks)**, annotated with **Label Studio**.
- Integrated Retrieval-Augmented Generation (RAG)** and **tool-calling agents** to improve contextual reasoning and response accuracy.
- Deployed a **real-time inference API** using **FastAPI** for scalable text and image interactions.

- Monitored and debugged LLM workflows using **LangSmith**, improving system observability and reliability.
- Delivered a **production-ready AI system** combining NLP, computer vision, and backend services with strong performance.

Lending Anomaly Analysis Dashboard (Visualization) (Excel, Looker Studio)

- *Finance Analytics / Data Visualization Project*

Designed and developed an interactive **finance dashboard** to analyze lending anomalies and extract actionable business insights. Used tools like **Looker Studio / Excel** to visualize key metrics such as **loan amounts, approval status, default rates, credit scores, and customer segments**. Identified irregular patterns and risk clusters to support **data-driven decision-making** for loan approval and risk management. The project helped highlight potential credit risks and optimized approval logic across branches.

Airline & Coca-Cola Forecasting: Applied time-series forecasting techniques to predict demand trends; evaluated model accuracy with cross-validation and visualized forecast patterns for decision-making insights.

Forest Fire Prediction (Neural Network): Built a Sequential neural network in Keras to predict forest fire size; applied K-Fold cross-validation and GridSearchCV with KerasRegressor for optimal hyperparameter tuning, achieving improved model fit and accuracy.

Advanced Excel Data Modeling & Business Analysis Project

- Designed structured Excel models using nested formulas, logical functions, and lookup functions.
- Used Data Analysis ToolPak for regression and statistical evaluation.
- Automated calculations and built an interactive dashboard.
- Applied business decision-making frameworks based on quantitative outputs.
