Education

Kennesaw State University | Kennesaw, GA

Bachelor of Science in Computer Science

Skills

Languages: Python, SQL, Java

Data Engineering: ETL/ELT, Dimensional Modeling, Data Modeling, Data Warehousing, Data visualization, Data Validation (Great Expectations), Airflow

Data Manipulation: pandas, NumPy, Jupyter, Apache Spark

Databases: PostgreSQL, MongoDB, Snowflake

Visualization: Tableau, Power BI

Cloud & Infra: AWS (S3, Lambda), Docker, DevOps

Tools: Git, Jenkins, Postman

Experience

Data Analyst Intern

May 2023 – August 2023

Formbuilder Inc | Atlanta, GA

- Built Python ETL pipelines with pandas to clean and normalize raw business data, producing analytics-ready datasets for downstream PostgreSQL reporting.
- Optimized SQL transformations and query plans, reducing pipeline execution time by ~40%
- Developed PostgreSQL schemas and analytical views that supported KPI reporting and downstream BI dashboards.
- Automated ingestion workflows using SQLAlchemy to load transformed datasets into PostgreSQL for analytics and reporting.
- Worked with analysts and business stakeholders to validate reporting requirements and deliver analytics-ready datasets for quarterly reporting.

Quality Assurance Engineer Intern

May 2024 - August 2024

CSAA Insurance Group | Glendale, AZ

- Automated SQL-based validation checks across ETL pipelines to verify data completeness, schema consistency, and accuracy before deployment.
- Integrated automated data validation into Jenkins CI/CD pipelines, reducing the risk of releasing inaccurate production data.
- Collaborated with engineering teams to identify upstream data issues and reduce downstream analytics errors

Projects

DineNGo Restaurant Analytics Dashboard

Kennesaw State University | Kennesaw, GA

- Designed and maintained a PostgreSQL schema to support customer, inventory, and order data warehousing for analytics processing.
- Built ETL processes to ingest, clean, and structure data from Clover and Square APIs into SQL and MongoDB for reporting use cases.
- Developed logic to trigger inventory alerts based on stock thresholds and implemented historical trend tracking for AI-based sales recommendations.
- Collaborated with team to build backend data services supporting sentiment analysis and natural-language-to-SQL analytics features.
- Ensured data quality, security (SQL injection prevention), and system performance in an agile development lifecycle.

CourtVision | Cloud Data Engineering Platform

Python | Airflow | AWS S3 | Snowflake | PostgreSQL | FastAPI | Power BI | SQL | Docker

Link: <https://github.com/jayzbros/courtvision-data-pipeline>

- Designed and built an end-to-end ELT data platform that ingests historical NBA data from the NBA API into a Snowflake cloud data warehouse.
- Orchestrated automated pipelines with Apache Airflow running in Docker to extract, validate, archive, transform, and load multi-season datasets.
- Implemented a layered data architecture consisting of Local Raw => AWS S3 => Snowflake RAW => Snowflake Analytics => PostgreSQL Serving Layer, supporting traceable movement from raw ingestion through downstream serving.
- Developed dimensional models (DIM), fact tables (FACT), season aggregates, and analytical SQL models in Snowflake.
- Implemented incremental MERGE loading in Snowflake to support historical multi-season ingestion while preventing duplicate records.

- Built a FastAPI service exposing REST endpoints for player, team, game, and leaderboard analytics backed by PostgreSQL.
- Developed an interactive Power BI dashboard with season, team, and player filtering for exploratory analytics.
- Containerized application and orchestration components with Docker for reproducible local development and deployment
