

Venkat Dhulipalla

Java Full Stack Developer

SUMMARY

Mobile: +1 (551) 230-1606
Email: venkatd5191@gmail.com
Address: Denton, TX, USA
[LinkedIn](#) | [GitHub](#) | [Portfolio](#)

Skilled Java Full Stack Developer with 4+ years of experience in fintech and e-commerce, specializing in building scalable applications using Spring Boot, React.js, and AWS. Expertise in microservices architecture and CI/CD tools, achieving 35% faster deployments. Collaborative team player with strong problem-solving skills, adept at database optimization (MySQL, MongoDB) and mentoring junior developers to enhance team productivity. Also, has a certification as an AWS Certified Developer Associate and AWS Cloud Practitioner.

SKILLS

Programming Languages:	Core Java, C, C++, SQL, C#, Python, JavaScript
Frameworks:	Struts, Hibernate, Spring Boot, Spring Batch, Spring Security, Spring AOP, Spring Core, Spring IOC, Angular 12, jQuery, Node.js, React.js, Express.js
Web Technologies:	HTML, HTML5, CSS/CSS3, AJAX, jQuery, Bootstrap, XML, JSON, UI Material, SASS, Typescript, ES6, Redux, React Hooks, REST API, RESTful API
Java/J2EE Technologies:	Servlets, Spring, EJB, JPA, JTA, JDBC, JSP, JSTL, Webservices, Microservices, Spring MVC, Hibernate, ORM
Database:	Oracle SQL, MySQL, MongoDB, PostgreSQL, PL/SQL, DynamoDB
Cloud Platforms:	Amazon Web Services (AWS), Google Cloud Platform (GCP)
IDEs:	Visual Studio Code, Eclipse IDE, IntelliJ IDEA, Spring Tool Suite (STS)
Web/Application Servers:	Oracle WebLogic, IBM WebSphere, Apache Tomcat, JBoss
Testing Tools:	JUnit, Mockito, Selenium
Build/ Other Tools:	Maven, Gradle, ANT, Jenkins, Docker, Kubernetes, SOAP/REST API, Postman, Jira, SonarQube, Kafka, Jupyter
Methodologies:	SDLC, Agile, Waterfall, SCRUM
Version Control:	Git, GitHub, SVN, Bitbucket
Operating System:	Windows, Linux, Mac OS

EXPERIENCE

- Java Full Stack Developer | J.P. Morgan & Chase – TX** **Aug 2023 – Present**
- Enhanced mobile payment processing system for a banking application, reducing transaction times by 20% and significantly improving user experience on mobile platforms, leading to increased customer satisfaction and higher transaction success rates for digital banking customers.
 - Leveraged Spring Boot's auto-configuration and dependency injection to minimize boilerplate code by 40%, simplifying the configuration of banking components such as payment gateways, data sources, and messaging queues, which resulted in 30% reduction in development time for adding new features like fraud detection and transaction alerts.
 - Designed and implemented responsive web interfaces using ReactJS and JavaScript, improving the user flow during mobile banking transactions and reducing friction by 25%, contributing to a 20% increase in successful transaction completions and a 15% decrease in bounce rates across mobile and online banking platforms.
 - Optimized database performance using MySQL for secure storage of transaction data and Hibernate for Object-Relational Mapping (ORM), enhancing the efficiency of SQL queries and access layers, leading to a 25% improvement in transaction processing speed in the banking system.
 - Improved asynchronous payment transaction processing by applying Java's Concurrency features (ExecutorService, CompletableFuture), enabling faster processing of high-volume transactions, improving system throughput, and reducing latency during peak banking hours.
 - Implemented Spring's declarative transaction management to ensure consistent and reliable handling of financial transactions, including rollback functionality, maintaining data integrity during high-volume periods like end-of-month or quarterly banking cycles.
 - Utilized Amazon S3 for secure storage and retrieval of banking transaction data, logs, and system artifacts, optimizing debugging and real-time monitoring of payment processing systems, which is critical for ensuring seamless customer experiences in online banking.
 - Employed Apache Kafka to decouple microservices and implement an event-driven architecture, managing high-throughput transaction events and enabling seamless communication between front-end applications, payment

processors, and banking back-end systems.

- Boosted system responsiveness by leveraging Java's multi-threading capabilities to handle concurrent payment processing, improving system performance by 35% during peak transaction times and ensuring more efficient processing of large volumes of banking transactions.
- Collaborated in an Agile environment, actively participating in sprint planning, daily standups, and closely working with product owners, developers, and QA teams to ensure timely delivery of high-quality, customer-centric features for the banking payment system.

Java Full Stack Developer | Capgemini – India

Sept 2019 – Aug 2022

- Led the development of a web-based inventory management system to automate key processes such as order processing, real-time stock tracking, and order fulfillment, optimizing supply chain efficiency and reducing operational bottlenecks.
- Implemented MongoDB for storing non-relational, semi-structured data (product catalogs, transaction logs, and order histories), leveraging its flexible schema and high-performance read/write capabilities to support system's scalability.
- Developed a microservices architecture for the inventory management platform, where individual services (product management, order processing, inventory tracking) were decoupled to enhance system flexibility and scalability.
- Created two-way data binding using Vue.js, ensuring real-time synchronization between the UI and backend, so that inventory and order details were instantly reflected on the client side, enhancing the user experience and providing up-to-date information.
- Integrated OAuth 2.0 and JWT (JSON Web Tokens) to secure APIs, enforcing role-based access control and ensuring that only authorized users (admin or authenticated customers) could access or modify sensitive data, such as inventory levels, orders, and payment details.
- Optimized HTML structure for accessibility and SEO, using semantic tags like <header>, <footer>, <section>, and <article> to ensure a clean, maintainable, and well-organized markup for the inventory management platform.
- Made core business logic in Java for the system, including features for managing product stock, processing orders, and handling real-time updates, ensuring robust transaction management and efficient system performance.
- Designed and implemented pagination and filtering in the inventory and order APIs, enabling clients to request large datasets in smaller chunks and filter results by parameters like product category, order status, or date range, improving API performance by 40% and reducing server load by 30%.
- Collaborated in the development of High-Level Design (HLD) documents for the inventory management system, aligning client requirements with technical solutions to optimize order processing, real-time inventory tracking, and order fulfillment, ensuring clarity and alignment with project objectives.
- Standardized data exchange using JSON, ensuring lightweight, human-readable, and easily consumable API responses for inventory and order data, improving interoperability and performance.
- Built dynamic and responsive UIs with Angular, providing users with real-time updates on stock levels, order statuses, and transaction details, resulting in a 25% reduction in user drop-off rates and a 35% increase in engagement.
- Leveraged Spring Boot's transaction management features to ensure ACID compliance for financial transactions, such as orders and payments, maintaining data consistency and reliability, which reduced transaction failures by 30% and improved overall system stability by 20%.
- Implemented AJAX to fetch data asynchronously from backend APIs, reducing page load times and delivering a seamless, non-blocking user experience, especially during inventory updates and order processing.
- Utilized Java 8+ features such as Lambda Expressions and Stream API, in combination with Spring Boot, to transform detailed Low-Level Designs (LLD) into scalable, high-performance modules for the inventory management system, optimizing real-time order processing, inventory tracking, and seamless integration between microservices.
- Integrated automated testing into the CI pipeline using JUnit, Mockito, and Selenium, ensuring the quality of the codebase by running unit, integration, and end-to-end tests with every new commit to catch defects early in the development process.
- Used Mockito to create mock objects for unit testing, isolating components and enabling focused tests of individual methods without dependencies on external systems, improving test reliability and coverage.

EDUCATION

Master of Science in Computer Science | University of North Texas, Denton, Texas, USA

Bachelor of Technology in Electronics and Communication | Osmania University, Hyderabad, India

CERTIFICATION

- **AWS Certified Developer Associate**
- **AWS Cloud Practitioner**
