

Prudhvi V

Senior Full Stack Java Developer

saiprudhvi669@gmail.com

Ph: +1 9726630924

Professional Summary

Full Stack Java Developer with 7+ years of experience building secure, scalable microservices and SPAs for finance, banking, payments, brokerage and healthcare. Expertise in end-to-end development using Java 17+, Spring Boot 3.x, Angular/React, Kafka for event streaming, AWS/K8s for deployment, and compliance with PCI DSS/SEC. Delivered high-impact projects reducing latency by 20-30% and fraud by 20% at PNC, Fidelity, ICICI, and Anblicks.

Skills and Experience

- Highly skilled Full Stack Java Developer with over 7 years of experience in designing, developing, and deploying enterprise-level applications across Cards and Payments, Investment Banking, Healthcare, and Core Banking domains for leading organizations such as PNC, Fidelity, ICICI, and Anblicks.
- Proficient in end-to-end software development lifecycle (SDLC), including requirement analysis, system architecture design, frontend and backend development, testing, deployment, and maintenance, delivering robust and scalable solutions.
- Expertise in modern Java technologies, including Java 17, Spring Boot 3.x, and Hibernate, complemented by extensive experience with legacy systems like Java EE and COBOL, ensuring seamless integration and modernization efforts.
- Adept at developing responsive and user-friendly interfaces using Angular (versions 8–16), JavaServer Faces (JSF), and JSP, enhancing customer and internal user experiences across diverse applications.
- Strong background in designing and implementing RESTful and SOAP-based APIs using JAX-RS, Spring REST, and JAX-WS, facilitating integration with external systems like payment gateways, market data providers, and healthcare services.
- Experienced in database management with PostgreSQL, Oracle, MySQL, and MongoDB using Java JDBC and Hibernate ORM, optimizing data storage and retrieval for high-performance applications.
- Skilled in leveraging cloud platforms such as AWS and Azure, deploying applications with Docker, Kubernetes, and OpenShift, and automating CI/CD pipelines using Jenkins and GitLab for efficient delivery.
- Proficient in real-time processing and event-driven architectures using Apache Kafka, Redis caching, and WebRTC, enhancing transaction speed, scalability, and user engagement in payment and telemedicine systems.
- Demonstrated ability to ensure compliance with industry standards, including PCI DSS, HIPAA, SEC, and FINRA, by integrating security protocols like 3D Secure, tokenization, and Spring Security.
- Extensive experience in testing and quality assurance, utilizing JUnit 5, Mockito, and Swagger for API documentation and validation, ensuring robust and reliable software solutions.
- Proven track record in collaborating with offshore teams, coordinating development efforts, and mentoring junior developers to align with project goals and best practices, enhancing team productivity and code quality.
- Adept at performance optimization using Java profiling tools (e.g., VisualVM, JProfiler), AI/ML libraries (e.g., DeepLearning4j), and caching mechanisms, reducing latency and improving system efficiency.
- Experienced in monitoring and maintaining production systems using tools like Prometheus, Grafana, ELK Stack, and IBM Tivoli, ensuring high availability and operational stability.
- Strong documentation skills, maintaining comprehensive technical documentation for system architecture, APIs, and deployment processes, supporting audits, compliance, and team knowledge sharing.
- Recognized for delivering impactful projects, such as real-time payment authorization systems, high-frequency trading platforms, telemedicine solutions, and core banking enhancements, driving operational efficiency and business value.

Technical Skills

Programming Languages : Java (17-21), TypeScript, JavaScript (ES6+), SQL, Bash, Groovy

Frameworks & Technologies	:	Spring Boot 2.x–3.x, Spring MVC, Spring Cloud Gateway, Spring Security (OAuth2.1, JWT, RBAC), Hibernate (JPA), Resilience4j, Micronaut, Node.js, Express.js, Lombok, MapStruct
Frontend Technologies	:	Angular (4.x–7.x), React (19.x), Redux, Redux Toolkit, RxJS, NgRx, TypeScript, HTML5, CSS3, Bootstrap, Material-UI, Tailwind CSS, jQuery, AJAX
Cloud & DevOps	:	AWS (ECS, EKS, Lambda, RDS, S3, ElastiCache, CloudWatch, Secrets Manager), Azure (Blob Storage, Active Directory), Docker, Kubernetes, Terraform, Helm, Jenkins, GitHub Actions, Azure DevOps, HashiCorp Vault, AWS CodePipeline
Databases	:	PostgreSQL, MongoDB (7.x), MySQL, Oracle, Redis (ElastiCache), Cassandra, H2, Snowflake
Messaging & Event Streaming	:	Apache Kafka (3.x, AWS MSK, Azure Event Hubs), RabbitMQ, ActiveMQ
Testing & QA Tools	:	JUnit 5, Mockito, Testcontainers, Cypress, Selenium, Jest, React Testing Library, Postman, Karate, Cucumber (BDD), SonarQube
Build & CI/CD Tools	:	Maven, Gradle, Jenkins, GitHub Actions, Azure DevOps, Terraform, Helm
Application & Web Servers	:	Apache Tomcat, Jetty, AWS Elastic Beanstalk, Oracle WebLogic, WebSphere
Documentation & Collaboration	:	Swagger/OpenAPI, Confluence, Jira, Git (GitHub, GitLab, Bitbucket), SVN
Developer Tools & IDEs	:	IntelliJ IDEA, VS Code, Eclipse, Postman
Infrastructure & Observability	:	Prometheus, Grafana, ELK Stack (Elastic 8.x), AWS CloudTrail, Azure Monitor, Jaeger, OpenTelemetry, Log4j, SLF4J

Professional Experience

PNC, Dallas, Tx.

July 2023 - Present

Senior Full Stack Java Developer

Project: - PNC Travel Rewards Platform (PTRP)

Description: Developed a real-time payment authorization system for a major retailer, enabling secure and efficient transaction processing. Utilized Angular 15+ for a merchant dashboard, Java Spring Boot 3.x for backend logic, and Apache Kafka for real-time transaction streaming. Integrated PostgreSQL for transaction data storage and Redis for caching, achieving sub-second authorization times. Deployed the system using Docker and Kubernetes on AWS, ensuring scalability and high availability. Implemented 3D Secure protocols and AI/ML-based fraud detection, reducing fraudulent transactions and enhancing customer trust.

Responsibilities:

- Architected and implemented microservices-based financial systems using Java Spring Boot 3.x and Spring Cloud, enabling secure, high-throughput transaction processing with sub-second authorization times.
- Designed and enforced security protocols including tokenization, encryption, and 3D Secure, reducing potential fraud and ensuring PCI DSS and regulatory compliance.
- Developed core business logic using Java 21 and Spring WebFlux, enabling non-blocking, reactive transaction flows and improving processing throughput by 40% during peak loads.
- Leveraged Apache Kafka for real-time event streaming and Event Sourcing, powering asynchronous transaction processing and reducing latency by 35% for high-volume payments.
- Optimized relational databases (PostgreSQL on AWS RDS) and implemented Redis caching via AWS ElastiCache, maintaining sub-second authorization latency and improving overall system responsiveness.
- Deployed containerized microservices using Docker and AWS EKS, achieving elastic scalability, high availability, and zero-downtime deployments for mission-critical payment services.
- Built CI/CD pipelines with AWS CodePipeline, Jenkins, and GitHub Actions, automating build, test, and deployment workflows and reducing deployment times from hours to minutes.

- Implemented unit and integration tests using JUnit 5 and Mockito, ensuring robust system functionality and reliability for real-time financial transactions.
- Implemented centralized monitoring and observability using AWS CloudWatch, Prometheus, and Grafana, proactively detecting system anomalies and reducing downtime by 20%.
- Developed responsive Angular 15+ dashboards for merchant stakeholders, providing real-time transaction insights and improving reporting efficiency by 30%.
- Stored transactional logs and analytics datasets in AWS S3, supporting regulatory audits and enabling AI/ML-based fraud detection retraining for enhanced accuracy.
- Coordinated Agile sprints using Jira for task management, tracked API design and integration with Swagger, and tested endpoints via Postman, ensuring timely delivery of high-quality features.
- Mentored junior developers on Java, Spring Boot, microservices design, and cloud-native best practices, fostering a high-performing team culture.
- Maintained comprehensive documentation for system architecture, APIs, security, and deployment processes to support collaboration, compliance, and knowledge transfer.

Environment:

Java 21, Java Spring Boot 3.x, Spring Cloud, Spring WebFlux, Resilience4j, Angular 15+, Apache Kafka, PostgreSQL, Hibernate, Redis, Docker, Kubernetes (EKS), AWS (RDS, ElastiCache, S3, CloudWatch, CodePipeline), Jenkins, GitHub Actions, JUnit 5, Mockito, Prometheus, Grafana, Swagger, Postman, Jira, AI/ML-based fraud detection tools, 3D Secure, Tokenization, Encryption.

Fidelity Investments, Dallas, Tx

Aug 2022 – May 2023

Full Stack Developer

Project: Fidelity Digital Brokerage Platform

Description: Developed a high-frequency trading platform for Fidelity's investment banking division to execute trades in volatile markets. Utilized Angular 15 for a trader dashboard, Java Spring Boot 2.7.x for backend logic, and Oracle for trade data storage. Integrated REST APIs for real-time market data and deployed using Docker and Kubernetes on Azure. Optimized performance with Redis caching and Java concurrency, reducing trade execution time by 30%. The platform enhanced trading efficiency and profitability, supporting competitive edge in investment banking.

Responsibilities:

- Designed and implemented low-latency trading systems using Java Spring Boot 2.7.x and Spring Cloud microservices, leveraging Config Server and Service Discovery to enable scalable, distributed services, reducing trade execution delays by 30%.
- Developed algorithmic trading logic in Java 17, optimizing high-frequency trade execution accuracy, improving profitable trades by 15% under volatile market conditions.
- Integrated risk analysis models and security controls using Java libraries, ensuring SEC and FINRA compliance, preventing regulatory violations and reducing audit issues by 25%.
- Architected data storage solutions combining Oracle SQL and NoSQL (DynamoDB) for trade data, analytics, and historical transactions, improving query performance by 20% for real-time reporting.
- Leveraged Redis caching and Java concurrency (ExecutorService) to minimize latency and maximize throughput of critical trading operations.
- Built RESTful APIs for real-time market data integration with Bloomberg, Reuters, and other sources, ensuring uninterrupted data flow for low-latency trading.
- Implemented messaging pipelines using Kafka and AWS SQS/SNS, enabling reliable, scalable asynchronous event-driven trading workflows and reducing system bottlenecks during peak trading hours.
- Deployed trading applications on AWS EKS with Docker containers, implementing Terraform for infrastructure-as-code, achieving scalable, fault-tolerant deployment and repeatable environments.
- Automated CI/CD with AWS CodePipeline, CodeBuild, and Git, reducing deployment time from hours to minutes while maintaining high system reliability.
- Implemented CloudWatch, X-Ray, and ELK Stack for end-to-end cloud monitoring and performance tracing, identifying latency spikes and reducing downtime by 20%.
- Conducted unit and integration testing with JUnit 5 and Mockito, ensuring system stability and preventing high-frequency trade failures, reducing production errors by 40%.
- Partnered with traders and analysts in an Agile environment, using Jira for sprint/task management and Swagger/Postman for API design/testing, gathering requirements and ensuring 25% fewer requirement gaps.

- Collaborated with quantitative analysts to validate and fine-tune trading algorithms, increasing trading profitability by 12% during volatile markets.
- Mentored junior developers through code reviews and knowledge sharing, reducing defect rates by 20% and improving team productivity.
- Developed real-time trading dashboards using React, integrated with Java REST APIs, providing traders with actionable market insights for faster decision-making and improved trade performance.
- Documented system architecture, APIs, and deployment processes, enabling knowledge sharing, audit readiness, and smooth onboarding for new team members.

Environment:

Java 17, Java Spring Boot 2.7.x, Spring Cloud (Config Server, Service Discovery), Spring Data JPA, Hibernate, React, REST APIs, JUnit 5, Mockito, AWS EKS, Docker, Terraform, AWS CodePipeline, AWS CodeBuild, Git, AWS CloudWatch, AWS X-Ray, ELK Stack, Oracle SQL, DynamoDB (NoSQL), Redis, Kafka, AWS SQS, AWS SNS, Jira, Swagger, Postman.

ICICI, Bengaluru, India

Jul 2019 - Jun 2021

Full Stack Java Developer

Project: Core Banking Transaction Processing Enhancement

Enhanced core banking system to handle increased transaction volumes for retail customers. Utilized Angular for internal dashboards, Java 11 and Spring Boot for backend logic, and Oracle for data storage. Integrated RESTful APIs for external payment systems and deployed updates using Jenkins on AWS. Optimized transaction processing with VisualVM, improving speed by 15% and reducing customer wait times, thereby enhancing operational efficiency.

Responsibilities:

- Developed and optimized core banking transaction processing logic using Java 11, Spring Boot, and Spring Cloud, enabling high-volume, low-latency transactions and improving throughput by 15%.
- Refactored legacy monolithic components into microservices, enhancing modular scalability and accelerating feature deployment across distributed systems.
- Implemented Spring Security with OAuth2 and JWT for secure authentication and authorization, ensuring regulatory compliance and safeguarding customer data.
- Designed and integrated RESTful APIs to connect internal systems with external networks such as SWIFT and payment gateways, reducing transaction latency by 15%.
- Leveraged Azure Service Bus for asynchronous message handling and reliable inter-service communication, improving transaction consistency during peak loads.
- Utilized Oracle with Spring Data JPA and Hibernate for efficient transaction persistence, optimizing database performance and reducing query times by 25%.
- Deployed microservices on Azure Kubernetes Service (AKS) to achieve elastic scaling and maintain 99.9% system uptime during high transaction volumes.
- Configured Azure Key Vault for secure management of credentials, API keys, and encryption secrets, reinforcing data protection and compliance controls.
- Implemented Azure Blob Storage for long-term archival of transaction logs and audit reports, ensuring adherence to data retention policies.
- Developed automated batch workflows using Spring Batch for nightly reconciliation and balance rollups, improving financial accuracy and reducing manual intervention.
- Streamlined CI/CD pipelines using Azure DevOps to automate build, test, and deployment workflows, cutting release cycle times by 40%.
- Created robust unit and integration tests with JUnit 5 and Mockito, achieving high code reliability and minimizing production defects.
- Monitored performance and system health using Prometheus, Grafana, and Azure Application Insights, proactively identifying bottlenecks and reducing downtime by 40%.
- Developed internal dashboards using Angular and Spring REST, empowering banking staff with real-time visibility into customer and transaction data, improving service response times by 30%.
- Collaborated with cross-functional teams in Agile (Scrum) sprints to align deliverables with compliance standards and business goals.
- Documented system designs, deployment workflows, and integration processes to support operational transparency and audit readiness.

- Diagnosed and resolved production issues related to transaction retries and API timeouts, maintaining service continuity within SLA thresholds.

Environment:

Java 11, Spring Boot, Spring Cloud, Spring Security, RESTful APIs, Oracle, Hibernate, Azure Kubernetes Service (AKS), Azure DevOps, Azure Service Bus, Azure Key Vault, Azure Blob Storage, Spring Batch, Prometheus, Grafana, Azure Application Insights, JUnit 5, Mockito, Angular, Git, Agile (Scrum).

Anblicks, Hyderabad, India

May 2017 - Jun 2019

Java Developer

Project: HealthLink Management System

Built a patient management platform for healthcare providers to improve access to care. Utilized Angular 10 (mid-project upgrade) for patient portals, Java Spring Boot 2.5.x for backend logic, and PostgreSQL for data storage. Integrated real-time communication features and ensured HIPAA compliance with Spring Security. Deployed using Docker on AWS, with Redis caching improving data retrieval speed. The platform reduced waiting times, enhancing service delivery efficiency.

Responsibilities:

- Collaborated with healthcare providers to gather requirements for electronic health records (EHR) and telemedicine systems, ensuring user needs were met.
- Collaborated with healthcare providers to gather requirements for electronic health records (EHR) and patient management systems, ensuring user needs were met and regulatory compliance.
- Designed scalable healthcare applications using Java Spring Boot 2.3.x–2.6.x and microservices architecture to support patient data management.
- Developed patient portals using Angular 8 (upgraded to Angular 12), integrating with Java REST APIs for seamless user experience.
- Implemented core workflows using Java 11 and Spring Boot 2.3.x–2.6.x, managing records, appointments, and billing processes.
- Created RESTful APIs with Spring REST for integration with third-party systems, such as insurance providers and lab services.
- Optimized PostgreSQL databases using Spring Data JPA and Hibernate to store and retrieve patient records efficiently.
- Ensured HIPAA compliance by integrating encryption and authentication mechanisms using Spring Security and Java libraries.
- Wrote unit and integration tests using JUnit 5 and Mockito to ensure system reliability and data integrity.
- Deployed applications using Docker and Jenkins on AWS, automating CI/CD pipelines with Git for efficient delivery.
- Enhanced performance with Redis caching (Java clients) to improve data retrieval speed in patient portals and EHR systems.
- Integrated real-time communication features using Java-based APIs, enabling secure virtual consultations for patients and providers.
- Configured ELK Stack for monitoring system performance, data access patterns, and application logs.
- Documented system architecture, APIs, and compliance requirements to support healthcare audits and team collaboration.
- Collaborated with healthcare IT teams to integrate new features with existing systems, ensuring seamless operation.
- Resolved production issues related to data access and system performance, minimizing downtime and improving user satisfaction.

Environment:

Agile, Java 11, Spring Boot 2.x, Spring MVC, Spring Security (JWT, RBAC), Spring Data JPA, Hibernate, RESTful APIs, Apache Kafka 3.x, PostgreSQL, MongoDB, Redis, Angular 8-12, TypeScript, HTML5, CSS3, JavaScript (ES6+), Docker, Kubernetes, AWS EKS, Jenkins, Log4j/SLF4J, Prometheus, Grafana, Testcontainers, JUnit 5, Mockito, Git, Agile/Scrum.
