Summary

Backend developer specializing in Python and scalable system design. I am well-versed with technologies like PostgreSQL, RestAPIs, Git, and Django, and I apply strong state-modeling skills, clean code practices, and OOP-driven modular architecture to build reliable, maintainable backend programs driven by real world problem-solving experience.

About

After years of leading teams and solving complex operational problems in retail, I discovered a passion for building software. What began as curiosity about how systems and games worked behind the scenes grew into a full commitment to backend engineering. I specialize in Python and Go, building backend systems with clarity, modularity, and long-term scalability. I enjoy designing architectures that grow gracefully, modeling complex states, and applying real-world problem-solving experience to technical challenges. I thrive in environments where learning, iteration, and ownership drive the work forward.

Skills

Languages: Python, GO

Backend: REST APIs, state modeling, OOP, concurrency, CLI tools

Tools: Git, GitHub, GitHub Actions, Docker

Databases: PostgreSQL, SQLite

Other: Networking fundamentals, security principles, Linux, debugging, testing

Projects

[Neural Pet](#)

CLI-based virtual pet powered by a small LLM with a constrained, persistent personality, written in Python. Built a stateful behavior system, prompt-conditioning pipeline, and interaction loop to maintain consistent character behavior across sessions. It is backed by SQL for persistent storage imperative to maintain behavior between sessions.

[Weapon Forge](#)

Procedural weapon generator with **25,280+ possible combinations**, built without external libraries. Designed modular data models, randomization systems, and a lightweight combat simulator to showcase Python's strengths in OOP and stateful logic.

[Elioud](#)

A game built in **6 days** for a competition. Implemented gameplay logic, art pipeline, sound design, and UI from scratch, demonstrating rapid prototyping and full-stack problem solving under tight constraints .

Experience

Target / Closing Team Lead/ Specialty Sales Team Lead

March 2021 - PRESENT, Mooresville, NC

- Led teams of 10–20 associates, coordinating workflows and resolving operational bottlenecks.
- Solved problems of every kind as they arose, often under time-constraint and pressure
- Improved store processes through data-driven decision making and systems thinking.

Durham Technical Community College / IT Lab Intern

August 2020 - December 2020, Mooresville, NC

- Assisted students with networking, security, and system configuration labs.
- Maintained lab equipment and resolved technical issues.

Buckle / Sales Team Lead

June 2019 - December 2020, Durham, NC

Education

A.A.S in Applied Sciences / Durham Technical Community College

Dec. 2020

Network Security

Boot.dev

July. 2025 - May. 2026

<https://www.boot.dev/u/kristiansroberts>

Completed 30 courses and projects covering backend architecture, Go and Python development, functional and OOP programming, data structures & algorithms, SQL, and web-server fundamentals.
