

EDUCATION**Vellore Institute of Technology**

Master of Technology in Software Engineering

Vellore, India**(May 2019)****PROFESSIONAL SUMMARY**

Analytical and detail-oriented Data Analyst with experience in Python, SQL, dashboarding, automation, and statistical modeling. Former Data & Automation trainee at Robert Bosch, where I supported complex engineering datasets and automated critical workflows. Strong technical foundation in data cleaning, visualization, predictive modeling, and NLP-based insights. Driven to solve business problems through data storytelling and intelligent automation.

TECHNICAL SKILLS

Data Analysis: Python, Pandas, NumPy, Excel, Scikit-learn, PySpark

Data Visualization: Tableau, Matplotlib, Seaborn, Power BI

Programming: Python, C, C++, SQL

Others: NLP, RoBERTa, VADER, Automation, Statistical Models, Data Quality Checks

PROFESSIONAL EXPERIENCE

Robert Bosch Engineering and Business Solutions

Project Trainee — Data & Automation

- Analyzed large, multi-variant automotive datasets to support Audi Gen2+ Cluster Project teams.
- Automated runtime data processing for AUTOSAR components using Python, improving workflow efficiency.
- Built statistical and optimization models, enabling better data-driven decisions for engineering teams.
- Designed Python-based data validation checks and automated reporting pipelines.
- Reduced reliance on manual data processing by converting workflows into fully automated pipelines.

RELATED PROJECTS**Cardamom Market Data Mining & Tableau Insights**

- Automated collection of 5,000+ commodity pricing records using Python + Selenium and cleaned datasets using Pandas.
- Performed trend, correlation, and seasonality analysis to understand market fluctuations.
- Built interactive Tableau dashboards that supported data-driven pricing decisions for farmers and traders.

Amazon Reviews Sentiment Analysis (NLP)

- Processed and cleaned 20,000+ product reviews using NLP preprocessing and sentiment-scoring techniques.
- Compared VADER and RoBERTa models, achieving a 32% improvement in sentiment accuracy with transformer-based modeling.
- Visualized sentiment patterns by category to identify key drivers of customer satisfaction and complaints.

Face Recognition Attendance System + SQL Analytics

- Developed an automated attendance-tracking system and stored logs using an SQL database.
- Generated analytics to identify time-based usage trends, engagement patterns, and anomalies.
- Reduced manual tracking by 70% through automated reporting and facial recognition integration.

Streamlit Chat Analytics Dashboard

- Built a Streamlit-based data interface and logged user interactions for analysis.
- Categorized query types and usage patterns using Python statistical methods.
- Created analytics dashboards summarizing user behavior, peak usage times, and system performance.
