Education

Masters in Computer Science

University of Alabama at Birmingham, USA

Jan 2024 – May 2025

Technical Skills

Languages: C, C++, Javascript, Typescript, Java, Python, HTML/CSS, SQL

Frameworks: React.js, Next.js, Node.js, Redux, Fast API, Spring Boot

Tools/ Paradigms: Git, Github, REST APIs, Microservices, Kubernetes, Jira, Docker, Amazon Web Services, Microsoft Azure, Jupyter, Pycharm

Databases/OS: MySQL, MongoDB, AWS, Linux, Unix, Apache Kafka, Scala, Azure Databricks, Amazon S3, Amazon EC2, Lambda

Experience

Software Engineer II | Accenture

Jul 2022 – Dec 2023

- Developed a modular frontend framework that streamlined core functionalities across components, services, and modules. This reduced code duplication by 30% and allowed faster delivery of custom features, making it easier for the team to meet business needs.
- Transformed the backend architecture by migrating from a monolithic structure to microservices. This shift optimized resource usage, improved scalability, and cut infrastructure costs by 20%, ensuring the system could adapt seamlessly to changing demands.
- To improve system resilience, Upgraded the network architecture by moving from REST to gRPC. This change introduced better data contracts and security protocols, boosting data streaming speeds by 30% across microservices.
- created a dynamic Forms Library (similar to Google Forms) that simplified UI generation, payload structuring, and validations through configurations. This enabled the creation of 500+ forms and significantly reduced development time.
- To improve project oversight, Automated unit test reporting using CI/CD pipelines. This streamlined decision-making for senior architects and reduced manual review time by 65%.
- Additionally, Designed and implemented an API gateway to manage and secure communication between microservices. This resulted in enhanced security and a 15% reduction in latency, contributing to a smoother application experience.

Software Engineer I | Accenture

August 2021 – July 2022

- Developed and deployed the Accenture Learning Portal, automating user data reports for 245,000 employees. This not only eliminated manual processes but also improved data accuracy, which earned me the 'Innovation Employee Award'.
- managed over 350 SSL certificates across 12+ applications, using Venafi to orchestrate cryptographic keys. This approach ensured data integrity, timely renewals, and enhanced system reliability, ultimately minimizing service disruptions.
- To improve efficiency, Automated weekly unit test reports that were shared with senior architects. This streamlined decision-making and cut down manual review time by 65%, allowing the team to focus on higher-priority tasks.
- Created detailed and easy-to-follow documentation for updating the Confluence wiki with environment setup instructions across multiple applications. This simplified the onboarding process for new team members, reducing their ramp-up time.
- Developed a proactive monitoring system that used custom scripts to track SSL certificate expirations. This ensured 100% compliance and prevented unexpected outages, giving the team peace of mind.
- Additionally, Designed and implemented a centralized logging solution using ELK (Elasticsearch, Logstash, Kibana), enabling real-time log analysis and faster troubleshooting, which reduced incident resolution time by 40%.

Projects

Entertainment Club App | Typescript, React.js, MongoDB, AWS

- Implemented authentication module for members and theater employees using JWT Auth, and MongoDB.
- Created an admin dashboard for theater, show time and seat management.
- Deployed the system using AWS with an Auto Scaled EC2 Cluster and NGINX load balancer.

Course Management System | Next.js, Spring Boot, MySQL, AWS EC2 GitHub

- Built a robust Course Management System using Next.js, Spring Boot, and MySQL, incorporating features such as course enrollment, assignments, quizzes, grading, and admin controls to streamline functionality for 1,000+ students and faculty.
- Deployed the system on AWS EC2 with an Nginx load balancer, improving traffic distribution by 40%, enabling faster user request handling, and maintaining 99.9% uptime for enhanced reliability.

Personalized AI Travel App | Python, Streamlit, Google APIs, OpenAI API

- Built a personalized AI travel app to plan and manage user itineraries using Python and Streamlit for an interactive dashboard, improving customization based on preferences, budget, and timeline.
- Integrated APIs like Google Maps, weather services, and Google Calendar to provide real-time updates and AI-driven travel recommendations, enhancing user experience and trip planning efficiency.
