

AKHILESH PREETHAM RAVULA

Herndon, VA • (443) 858-8840 • akhilesh.preetham19@gmail.com • [LinkedIn](#)
(Open to Relocate)

Experienced **Data Analyst** with **5+ years** of experience delivering **enterprise-grade analytics and BI solutions** across **healthcare, retail, and manufacturing domains**. Proficient in **SQL, Python, Power BI, Snowflake, and Azure** to design **star schema models, build predictive ML pipelines, and deploy executive dashboards** that enable **data-driven decisions**. Recognized for optimizing **pipeline efficiency, reducing downtime, and improving forecast accuracy** through advanced analytics. Actively seeking full-time opportunities to drive innovation and lead large-scale data initiatives

AWARDS & CERTIFICATIONS

- [Microsoft Certified: Power BI Data Analyst Associate](#)
- [Oracle Cloud Infrastructure 2025 - AI Foundations Associate](#)
- “Pat on Back” Award - Cognizant

PROFESSIONAL EXPERIENCE

CARESOURCE

Data Analyst

Herndon, VA

May 2024 - Present

Project: Enterprise Financial and Utilization Performance Hub

A self-service Power BI solution for finance and operations leaders at CareSource to track health plan financials and medical utilization across states and products.

- A self-service **Power BI solution** for finance and operations leaders at CareSource to track health plan financials and medical utilization across states and products
- Wrote and maintained **complex SQL queries** involving **multi-table joins, CTEs, window functions, and nested logic** to analyze **multi-million-row datasets** across **SQL Server and Snowflake**
- Built **interactive Excel dashboards** using **pivot tables, Power Pivot, advanced formulas (INDEX-MATCH, SUMIFS, SUMPRODUCT)**, and **VBA macros** to support **finance and operations teams**
- Used **Python** extensively for **data exploration, cleansing, and transformation** of large **operational, manufacturing, and marketing datasets**, ensuring consistency before downstream reporting and modeling
- Collaborated with product owners and business SMEs in an **Agile** framework to prioritize analytics tasks and deliver high-impact dashboards and insights each sprint
- Partnered with finance, actuarial, and operations stakeholders to understand how they currently review performance and converted their questions into clear **KPIs** such as medical loss ratio, admin cost ratio, and denials rate
- Mapped data from claims, eligibility, provider, and product systems in **SQL Server** and **Snowflake**, and designed a star schema model with fact and dimension tables, so all reports pulled from one trusted structure instead of many **ad hoc joins**
- Built and optimized **SQL views** and stored procedures to handle business rules like capitation, adjustments, and exclusions, which removed many manual Excel steps that teams previously used to “fix” the data before analysis
- Created a reusable **Power BI semantic model** with shared **DAX** measures for revenue, paid claims, allowed amounts, and variance calculations, so different reports and teams used the same logic and numbers
- Implemented drill-down and drill-through paths in **Power BI** that allowed leaders to move from a high-level view by state and product into detailed views by member segment, provider group, and service category during performance reviews
- Set up automated refresh using **SQL Server Agent, Azure Data Factory, and Power BI** scheduled refresh, which cut monthly manual report preparation time by more than half for the finance team

- Tuned **long-running queries and reduced report load times** by indexing key tables and simplifying heavy **DAX calculations**, which made it realistic to use the dashboards live in meetings without delays
- Worked with **finance and operations leadership** to roll out the hub to end users through training sessions and simple documentation, which increased adoption and turned the solution into the primary source for monthly and quarterly financial reviews.

Project: Marketing Spend and Campaign ROI Insights for Health Plans

A marketing analytics dashboard that shows how different campaigns and channels contribute to member growth and where marketing money is being wasted.

- Integrated data from digital campaign exports, **CRM systems**, and cost files into a single reporting model that linked impressions, clicks, leads, enrollments, and costs at the campaign and channel level
- Built **Power BI reports** that showed cost per lead, cost per acquisition, conversion rates, and funnel drop off from impression to enrollment, broken down by state, product, and audience segment
- Helped marketing leaders compare the performance of campaigns side by side and identify low-performing campaigns and channels, which led to budget shifts away from poor performers toward higher return activities
- Added drill-through views that allowed users to move from a **high-level spend and ROI page** into detailed campaign-level views, including creative name and audience, in just a few clicks
- Implemented row-level security so regional and product-specific marketing users only saw campaigns relevant to their region and product, while senior leaders retained a full enterprise view
- Documented key **KPI definitions** and logic in Confluence and walked marketing analysts through the model so they could confidently answer questions about how each number was calculated

COGNIZANT

Senior Data Analyst

Client: Norwix

Hyderabad, India

Jan 2019 - Dec 2022

Project: Predictive Maintenance and Install Base Analytics for Printing Equipment

Developed an analytics solution that uses service history to identify machines and customers at higher risk of failure, helping Norwix plan preventive maintenance and reduce unplanned downtime.

- Collected and cleaned historical service, failure, and maintenance data, linking it with install base information such as machine model, age, usage, and environment to create a comprehensive analysis dataset
- Used **SQL** and **Python** to engineer features such as failure count over time, time since last service, usage patterns, and common error codes, and explored simple predictive models to score machines by risk of near-term failure
- Built **Power BI reports** that showed the installed base by risk segment, region, and customer, and that highlighted machines and customers that should be prioritized for preventive visits
- Provided operations and field service managers with views that helped them plan technician routes and spare parts inventory based on predicted risk instead of only reacting to breakdowns
- Documented model assumptions in clear non-technical language so business stakeholders understood that the solution was a prioritization tool that supported, not replaced, their domain judgment

Project: Customer Service Performance and Complaint Resolution Dashboard

An operations dashboard that tracks how quickly and effectively Norwix handles customer calls and complaints about industrial printing and marking equipment.

- Collaborated with customer service managers and team leads to map the full complaint life cycle, from first call to resolution, and translated it into measurable **KPIs** like first response time, average handle time, unresolved case count, and repeat call rate
- Designed **SQL Server** tables, views, and stored procedures that combined data from call logs, ticketing systems, and customer master records into a single, consistent reporting layer
- Developed **Tableau dashboards** to visualize **operational, financial, and performance metrics** for business stakeholders

- Enabled drill down into individual tickets, agents, and customers so supervisors could quickly investigate outliers, long pending cases, and recurring issues during daily stand-ups
- Helped reduce unresolved complaints over several months by making it easier to see stuck cases and reassign work, and by highlighting areas where additional training or knowledge base content was needed
- Trained supervisors and agents on how to use the dashboards and provided simple how-to guides that helped drive adoption and reduce reliance on static **Excel reports**

Project: Manufacturing Scrap Performance Dashboard

Designed a scalable Scrap Performance Dashboard by fixing KPI logic and modernizing the data pipeline, enabling faster, more reliable reporting for all plants.

- Identified a critical logic flaw in executive reporting and defined a 'Normalized Scrap' **KPI** (Scrap Cost vs. Production Cost), ensuring equitable performance benchmarking across manufacturing plants of varying production capacities
- Re-engineered a legacy **ETL pipeline** by establishing a direct connection between **Power BI** and **SAP Business Warehouse**, effectively eliminating an unstable, intermediate **Excel dependency** and **high-risk manual data handling**
- Reduced report refresh time by **40%** and decreased report failure rates by streamlining the data architecture, applying Lean principles to remove unnecessary processing steps
- Resolved a major scalability bottleneck by migrating data ingestion away from **Excel**, bypassing the 1-million-row limitation and preventing data loss for long-term historical analysis
- Led requirement gathering sessions with plant managers to map the end-to-end scrap journey, securing stakeholder buy-in to adopt the new standardized metric for bi-weekly and quarterly strategy reviews

SKILLS

- **Languages:** SQL, Python (Pandas, NumPy, Matplotlib, Scikit-learn, Seaborn)
- **Databases & Cloud:** SQL Server, Snowflake, PostgreSQL, Azure Data Factory (ADF), AWS (S3/EC2)
- **Power BI:** Desktop, Service, Dataflows, Gateway, RLS, Incremental Refresh, Composite/DirectQuery, Aggregations, Calculation Groups, Field Parameters, Bookmarks, Subscriptions, Star Schema Modeling
- **DAX & Power Query (M):** Time intelligence, context transition, variables, KEEPFILTERS, performance tuning, query folding, staging/reference patterns, custom functions
- **Sources/Connectors:** Azure SQL, Snowflake, SAP ECC, Salesforce, REST/OData, SharePoint/OneDrive, CSV/Excel connectors
- **Governance & Security:** Dataset certification, RLS design, naming conventions, usage telemetry, sensitivity labels
- **Tools:** Git, JIRA, Confluence, Power Automate, PowerPoint, Advanced Excel
- **IDEs:** Visual Studio Code, PyCharm
- **Machine Learning:** Supervised ML (Linear and Logistic Regression, Decision Trees, RF, XGBoost), Unsupervised ML (K-means, PCA), NLP, Classification techniques (Binary classification, Multi-class classification), A/B testing

EDUCATION

ST. FRANCIS COLLEGE

Master of Science in Project Management (Minor in Data Science) (GPA: 4/4)

New York, NY

Jan 2023 - Dec 2024

GITAM UNIVERSITY

Bachelor of Technology in Electronics and Communication Engineering

Hyderabad, India

June 2015 - May 2019
