SUMMARY

DevOps Engineer/DevSecOps/AWS Cloud Administrator/Linux System Engineer/System Administration experience for 6 years (overall I.T experience is 8 years). I also have 6 years of Windows Administration. Involved with the planning and engineering of enterprise infrastructure with Virtual Linux Machines. Also in charge of running functional tests on in-house applications. Performed scheduled maintenance, patching over 2000 virtual servers, and Cloud instances. Experienced in Deploying/Monitoring applications on servers. Experience in Cloud computing, BIG DATA, and Cybersecurity. Excellent technical and interpersonal skills. Experienced working with Agile, Kanban, Scrum, and ITIL methodology.

SOFTWARE & TOOLS

VMware ESXi, Linux (Red Hat) (Ubuntu), Oracle, AMRDEC, Splunk, Windows Server 2012 R2, Hadoop, Nagios, Apache, Tomcat,PHP, MySQL, FTP, BIND, Mediware, NFS, NAS, Gradle, Sonar, Package managements such as yum, rpm, apt, Git Hub, GitLab, Jenkins, Jira, New Relic, FogBugz, SharePoint, Bitlocker, Remedy Ticketing System, AWS, Microsoft Azure, WordPress, Confluence, ServiceNow, Maven, Nexus, Artifactory, Docker, Slack, VersionOne, Subversion (SVN), Solar Wind, Prometheus and Grafana, Kubernetes, Kibana, Elastic Search, Ansible, Docker UCP, Docker Swarm, BitBucket,Tenable.io, CloudFlare, DataDog, GaurdDuty, AlieanVault, Terraform, PagerDuty, LastPass, Code Pipeline, Sophos, CodeSignal, Visual Studio Code, Inspector, Atlassian Suit, ChatGPT, Okta, Paulse Secure, Qualys, FortiClient, Zscaler, STIG,

LANGUAGES

Shell Programming, Java, Visual Basic, Ruby, Bash, Python, Perl, Php, Yaml, Powershell

EXPERIENCE

Deloitte
Security Admin /Azure Admin
09/2024 - Present

- Use Qualys to run scans on Windows and Linux servers hosted on Azure.
- Implemented Infrastructure as Code Security: Integrated Prisma Cloud into CI/CD pipelines (e.g., Jenkins) to automatically scan Infrastructure as Code templates for vulnerabilities and misconfigurations before deployment.

- Implemented **Qualys Cloud Agent** across hybrid infrastructure (Windows, Linux, Azure VMs) to support real-time vulnerability monitoring and asset inventory.
- Tuned and customized **Qualys scan profiles**, including port scanning, authentication settings, and scan windows to optimize for production uptime.
- Created **custom remediation dashboards** using Qualys VMDR (Vulnerability Management, Detection, and Response), helping leadership prioritize risk by severity and exploitability.
- Automated QID-based vulnerability tracking using scheduled exports from Qualys API into Excel and Splunk dashboards for team-level accountability and trending.
- Monitored **Qualys scan failures and agent status**, coordinating with infrastructure teams to remediate agent communication issues and restore full scan coverage.
- Managed **exception handling processes**, tracking accepted risks or patch deferrals for QIDs that could not be immediately remediated, with documentation in compliance tools.
- Performed periodic audit reviews to validate that all critical assets had updated Qualys agents and were included in scheduled scans.
- Developed **response playbooks** for common Qualys findings, including remediation steps, responsible teams, and verification procedures post-fix.
- Participated in quarterly **vulnerability management meetings** to report KPIs such as mean time to remediate (MTTR), QID aging metrics, and scan completeness.
- Performed continuous vulnerability scanning on Windows and Linux servers using Qualys, identifying misconfigurations, missing patches, and zero-day vulnerabilities across Azure infrastructure.
- Created remediation workflows based on QID findings, collaborating with patch management teams to resolve high-priority vulnerabilities within SLA windows.
- Extracted actionable insights from Splunk queries to generate vulnerability reports, producing detailed Excel dashboards for QID tracking, aging analysis, and team-based remediation metrics.
- Provided hands-on support to remediation teams by walking them through CLI-based and GUI-based vulnerability fixes on Azure VMs, improving patch turnaround by 30%.
- Integrated Prisma Cloud Compute into CI/CD pipelines using Jenkins, enabling pre-deployment security checks for Terraform and ARM templates, reducing infrastructure drift.
- Developed policies in Prisma Cloud to enforce best practices for Azure services (e.g., NSG configurations, storage encryption, container image validation).
- Conducted cloud workload protection (CWP) by continuously scanning Azure Kubernetes clusters, containers, and serverless environments for anomalous behavior and policy violations.
- Automated compliance monitoring across cloud resources using Prisma Cloud, validating adherence to CIS benchmarks, NIST 800-53, and HIPAA frameworks with monthly reporting.
- Participated in incident response activities, including investigation of security alerts, identification of root causes, and coordination of mitigation actions across infrastructure and development teams.

- Continuous Cloud Security Monitoring: Utilized Prisma Cloud to continuously monitor cloud workloads, containers, and serverless functions for security risks and compliance issues, ensuring real-time threat detection and response.
- Vulnerability Management: Leveraged Prisma Cloud to identify and remediate vulnerabilities in container images and running workloads, reducing the overall risk posture of cloud-native applications.
- Compliance Automation: Automated compliance checks against industry standards (like CIS Benchmarks, PCI-DSS, HIPAA) using Prisma Cloud, ensuring that all cloud resources adhered to security policies and regulatory requirements.
- Created Excel spreadsheets for Vulnerable QIDs from Splunk queries
- I used Splunk search to run specified queries and get scan reports for specific QID Vulnerabilities reports.
- Helped multiple teams patch their vulnerabilities by walking them through best practices and commands to complete the tickets.
- Used ServiceNow to create tickets and assign them to the right teams to take care of, and complete.
- I worked on Azure servers running Windows and Linux OS for troubleshooting and installation.
- I configured multiple Ubuntu server CLI to have a GUI for specific application needs for our shareholders
- Researching and Implementing remediation for multiple vulnerabilities and attack vectors within our environment.
- Installed, configured, and managed HCL Workload Automation environments, ensuring robust and reliable scheduling for enterprise batch processing.
- Developed and implemented efficient scheduling strategies for batch jobs across distributed environments, optimizing resource utilization and system performance.
- Automated batch job dependencies and workflows, reducing manual intervention and ensuring error-free execution.
- Provided ongoing maintenance and troubleshooting of Workload Automation systems, ensuring high availability and compliance with SLAs.
- Integrated Windows Authentication (IWA) Master and Slave Management:
- Installed and configured IWA Master servers, enabling secure and seamless user authentication for enterprise applications.
- Set up and managed IWA Slave servers to execute scheduled jobs in distributed systems, ensuring compliance with enterprise security standards.
- Maintained and optimized IWA configurations to align with organizational requirements, including Kerberos-based authentication and fallback NTLM support.
- Monitored and managed IWA systems to ensure consistent performance and availability, resolving authentication and connectivity issues proactively.
- Scheduled and managed complex batch job workflows, coordinating across multiple systems to meet critical business deadlines.
- Configured dependencies, job priorities, and alert mechanisms to ensure seamless execution and timely completion of scheduled tasks.
- Collaborated with cross-functional teams to integrate new batch jobs into the scheduling environment, aligning with operational requirements.
- Infrastructure Configuration and Maintenance:

- Designed and implemented secure, scalable infrastructures for workload automation and authentication systems.

**P.S.I, Arlington VA,
Linux System Engineer/ Windows Administrator (Contract)
10/2023 - 8/2024**

- Supporting the Blood donor project, providing Applications Support and configuration for the Military.
- Hardening multiple servers by using the DOD standard policy, and software such as STIG viewer for increased security.
- Configuring networks for the Mobile Servers, such as creating a fully qualified domain name, and static Ip addresses, etc..
- Installing and configuring the software on the mobile server.
- Using PXE Boot to re-image the mobile servers with the specifications of the current window and software for our environment.
- Smoke testing our LifeTrack application for QA proposes to increase proficiency for the product.
- Participate in system design planning, review, and implementation of working groups.
- Participated in providing technology assessments in support of automation and technology migration initiatives.
- Recommended improvements; maintain/monitor production and non-production systems to ensure infrastructure performs at maximum efficiency.
- Provided support for our applications, including escalation and system performance of production platforms, and resiliency.
- Developed and maintained plans to ensure a successful recovery and resiliency of operating systems in the event of a disaster according to the Disaster Recovery policy.
- Perform systems analysis and tuning to ensure optimal operating system response for multi-user applications.
- Implement/maintain IT security guidelines.
- Used innovative methods and technologies to identify and solve problems related to performance, scalability, reliability, and availability.
- Automating operational processes using scripting languages.
- Developed, implemented, and continually improved the system and network monitoring and alerting capabilities and procedures.
- Written knowledge base documents to improve operations, SOP, and contribute to IT organization.
- Using the Remedy ticketing tool and FogBugz to troubleshoot issues for our client sites and shareholders.
- Running patches on Oracle WebLogic to reduce software vulnerability.
- Troubleshooting LifeTrack application software issues for individual sites throughout the Military bases (Air Force, Army, and Navy)
- Securing Mobile Servers with BitLocker security encryption.
- Using Oracle Enterprise Manager to run database queries and troubleshoot issues that occur.
- Able to travel to different military locations to assist with issues pertaining to the services we provide, and to strengthen vendor relationships and the quality of services we provide.
- Installing and configuring Integrity checker tools for our environment to meet DOD regulations, such as an audit.
- Set up cron and anacron for automated tasks within the servers.
- Supporting the WebLogic application running on Windows 2008 R2, 2012 R2, 2015 R2
- Strategizing on Infrastructure changes needed to support future scalability options.

- Using the command line on RHEL 5 for file Management, User Management, schedule Maintenance, and troubleshooting.
- Writing SOPs on how to re-image, install, configure, and run the LifeTrack software, etc... to teammates on SharePoint
- Using the Excel spreadsheet to document changes on all mobile servers, and providing weekly status reports for the ARMY, NAVY, USAF.
- Design and deploy failover clustered Hyper-V environments.
- Along with VMWare, the client used HYPER-V for some Windows servers.
- Management of Hyper V production platform, development platform, and DMZ platform.
- Installed and configured Citrix Xen Server and Windows 2008 Hyper-V R2 on Dell Hardware with ISCSI networks.
- Introduced the new login system for all the employees, tuning the current process by decreasing the number of steps in the authentication process to half and improving the performance by 60%
- Configuring multiple authentication schemes like Forms, SSL Certificate Token based authentication and Integrated Windows Authentication (IWA)
-

Lockheed Martin, (Remote)

DevSecOps/Sr AWS Consultant

02/2022 - 10/2023

- Developed CloudWatch scripts for custom log monitoring on Windows AWS ec2 instances
- Installed cloudWatch agent on windows US-Gov-Cloud environments.
- Decommissioned over 30 ec2 instances with the best practice and compliance for Gov-Cloud environments.
- Managed SQL Server databases, ensured efficient performance, and maintained security and data integrity.
- Utilized AWS CloudWatch for monitoring SQL Server performance metrics, identifying potential issues, and initiating corrective actions.
- Facilitated backup and recovery solutions for SQL Server databases to ensure data reliability and availability.
- Assisted in developing automation scripts for routine database maintenance tasks, improving efficiency by 30%.
- Architected and implemented CI/CD pipelines for database changes using GitLab, significantly reducing code integration time and increasing deployment frequency.
- Managed AWS CloudWatch for comprehensive monitoring of applications, providing in-depth system and application metrics, logs, and alerts to ensure optimal performance and availability.
- Oversaw SQL Server database administration, ensuring high performance, security, and availability of the databases.
- Automated infrastructure deployment in AWS using Terraform and CloudFormation, which reduced provisioning time by 50%.
- Configured GitLab CI/CD pipelines to automate deployment process, reducing manual errors and improving productivity.

- Led the migration of SQL Server databases to AWS RDS, ensuring a smooth transition with zero downtime.
- Created a custom CloudWatch Dashboard to provide a unified view of the AWS resources and applications, enabling real-time troubleshooting and performance optimization.
- I had to write reports on how to merge 2 ec2 instances into 1 webapp instance. which I had to investigate data from CloudWatch, Trusted Adviser, Ec2, and Ebs volumes.
- I created alerts on Splunk for high CPU usage and Throughput for our on-prem servers.
- Went through training on Splunk to become a power user for our team.
- I ran Splunk queries to pull data from our on-prem environment.
- Setup Alerts on Splunk for high CPU, throughput, IOPS, and disk latency
- Spearheaded the integration of DataDog for end-to-end monitoring of AWS cloud applications, improving system visibility and operational efficiency.
- Designed and implemented over 30 custom dashboards to track key performance indicators (KPIs), system health, and user activities, facilitating quick decision-making and enhanced system monitoring.
- Configured and maintained alerting mechanisms in DataDog to monitor AWS services, including EC2, S3, RDS, and Lambda, ensuring prompt detection of performance issues and potential outages.
- Led the troubleshooting of complex alerts and resolved critical incidents, reducing downtime by 40% and significantly improving customer satisfaction.
- Collaborated with development and operations teams to refine monitoring strategies and implement best practices for cloud application management.
- Conducted regular reviews and updates of monitoring tools and practices, staying current with new technologies and features offered by DataDog.
- Provided training and support to new team members on the effective use of monitoring tools, enhancing team skills and knowledge in cloud application management.
- Managed AWS infrastructure, ensuring high availability and performance of web applications.
- Implemented comprehensive logging and monitoring using CloudWatch before transitioning to DataDog, which provided more granular insights and data analytics capabilities.
- Automated system maintenance tasks using AWS Lambda and CloudFormation, improving system reliability and reducing manual labor by 50%.
- Assisted in the migration of critical applications to AWS, ensuring seamless service continuity and minimal disruption.
- Installed our in-house Applications to run on our Cloud Windows environment
- Updating Correto versions and storing it in Nexus to improve our Java Applications via Jira tickets.
- Designed and implemented scalable storage solutions using Amazon S3, ensuring high durability, availability, and security for large volumes of data.
- Configured S3 lifecycle policies for efficient data archiving and cost management, utilizing storage classes such as S3 Standard, S3 Infrequent Access (IA), and S3 Glacier.

- Implemented S3 versioning and replication to maintain data integrity and ensure disaster recovery capabilities.
- Utilized S3 bucket policies and IAM roles for fine-grained access control, ensuring secure data access and compliance with organizational policies.
- Designed and deployed VPC architectures, including subnets, route tables, NAT gateways, and VPN connections, to ensure secure and efficient network communication.
- Implemented AWS Direct Connect for dedicated network connections between on-premises data centers and AWS, enhancing network performance and reliability.
- Configured and managed security groups, network ACLs, and VPC peering to ensure secure communication between AWS resources.
- Configured and managed Application Load Balancers (ALB) to distribute incoming application traffic across multiple targets, ensuring high availability and reliability.
- Implemented advanced routing features such as host-based and path-based routing, SSL/TLS termination, and Web Application Firewall (WAF) integration to enhance security and application performance.
- Monitored ALB metrics and logs using CloudWatch and integrated them with AWS Lambda for automated response and remediation.
- Maintaining ATO Compliance: Spearheaded efforts to ensure AWS cloud infrastructure remained compliant with Federal regulations, including NIST 800-53 and FedRAMP, ensuring the system maintained its ATO.
- Conducted security assessments and implemented security controls to align with compliance requirements.
- Collaborated with the Security Operations team to identify and remediate security vulnerabilities in accordance with RMF (Risk Management Framework).
- Performed regular audits and vulnerability assessments using tools such as AWS Security Hub, Amazon Inspector, and Splunk to monitor and mitigate potential security risks.
- Automation and Infrastructure Management:
- Automated the deployment of infrastructure using AWS CloudFormation and Terraform, ensuring resources were provisioned securely and consistently across multiple environments.
- Developed and managed CI/CD pipelines using AWS CodePipeline and Jenkins to streamline the integration of security patches and updates across production systems while adhering to ATO compliance.
- Implemented AWS Lambda for serverless automation tasks such as security logging and monitoring, which reduced manual efforts in system maintenance.
- Security Monitoring:
- Set up and configured AWS CloudWatch, GuardDuty, and AWS Config to monitor the infrastructure for security compliance and potential threats, responding to incidents within required SLAs.
- Developed and implemented automated alerts and response systems for critical vulnerabilities and compliance failures to ensure timely remediation and continuous monitoring of the platform.
- Collaboration for ATO Updates:

- Worked closely with cross-functional teams including cybersecurity, compliance officers, and program managers to gather evidence and documentation required for renewing and updating the system's ATO.
- Assisted in drafting System Security Plans (SSP), incident response procedures, and risk assessments to maintain compliance with evolving security regulations.

Happy Money, (Remote)

DevSecOps/InfoSec

06/2019 - 01/2022

- Used Tenable.io VM modules to implement EC2 scanning in all non-prod environments.
- Merged and committed code using Bitbucket following code management best practices.
- Used CloudFlare workers to set up a maintenance page in case of a down time within Happy Money.
- Using Tenable.io Core scans to properly harden our Container images
- Installed Tenable Core in our AWS environment and wrote down the documentation process. Using the Confluence page.
- Helped build and maintain an AWS cloud infrastructure architecture aligning security, compliance, performance, and resilience with cost
- Provide expertise & best practices for implementing cloud security(internal) & product security(external)
- Assess architectures & designs for security vulnerabilities & suggest & implement proper alternatives.
- Build, maintain, monitor, audit & report frameworks that produce artifacts that support security & compliance goals.
- Maintain a set of tools that enables developers to self-serve for most operational tasks.
- Added to our CI/CD pipeline and DevOps environment, designing & structuring AWS Infrastructure.
- Develop Terraform scripts to provision resources on AWS as Infrastructure as code
- Developed and managed RESTful and WebSocket APIs using Amazon API Gateway, enabling secure and scalable API services.
- Integrated API Gateway with AWS Lambda, AWS Step Functions, and backend services to build serverless applications and microservices architectures.
- Configured custom domain names, caching, and throttling policies to optimize API performance and enhance user experience.
- Writing Terraform module for DDOS and BadBot protection in code for AWS WAF and Shield.
- Deployed multiple AWS clouds resources using Terraform as an IAC tool
- Handle all security aspects in securing their applications.
- Learn & understand new technologies and industry practices
- Implement a standard DEVSECOPS pipeline across multiple application development teams.

- Source code configuration management repository (GitHub, GitLab, and code build).
- Configure continuous integration & continuous development leveraging
- Set up additional CloudFlare DDOS security for our production DNSs
- Altering our CloudFlare Security monitoring in addition to adding and removing DNS names via Jira tickets.
- Contributed to introducing additional tools like CheckMarx to our architectural & infrastructural needs.
- Implement and maintain Amazon Web Services (AWS) infrastructure
- Evaluate tools and technologies to improve Architecture & infrastructure.
- Send a weekly vulnerability list to our DevOps team for remediation.
- I was On-call at any time to respond to PagerDuty Alerts and resolve them. And document every alert for audit reasons.
- Often times investigated PagerDuty Alert and reach out to team members who had triggered it
- Administered Scans for the Log4J vulnerability issues using Cloudflare, Tenable.io, and AWS WAF
- Worked on Fixes to combat Log4J vulnerabilities for our Environments using Terraform Scripts.
- I sent instructions to each account holder responsible for our GitHub repo to update jar files with Log4J vulnerabilities. And kept an excel spreadsheet to update according to the update success.
- Installed AWS WAF version 3 as needed to better secure our environment for Log4J
- Building/Maintaining Docker container clusters managed by Kubernetes Linux, Bash, GIT, and Docker, on GCP (Google Cloud Platform). Utilized Kubernetes and Docker for the runtime environment of the CI/CD system to build, and test deploy.
- Configured and managed PagerDuty alerts to proactively monitor and respond to incidents and service disruptions.
- Created and maintained on-call schedules and escalation policies in PagerDuty to ensure timely response and resolution of critical incidents.
- Integrated PagerDuty with various monitoring tools, such as Nagios, Zabbix, and New Relic, to enable real-time notifications and incident management.
- Led incident response teams during critical incidents, using PagerDuty to coordinate response activities and communicate with stakeholders.
- Used PagerDuty analytics and reporting to track incident trends and identify areas for improvement in incident response processes.
- Participated in PagerDuty training sessions to stay up-to-date with the latest features and best practices for incident management.
- Worked with cross-functional teams to ensure that PagerDuty alerts and incident response processes are aligned with business needs and service level agreements.
- Troubleshoot and resolved PagerDuty-related issues, such as integration failures and notification delays, to minimize downtime and ensure reliable incident management.
- Contributed to the development of incident response playbooks and runbooks, which leverage PagerDuty as a key component of the incident management process.

- Collaborated with stakeholders to review and update PagerDuty policies and procedures, ensuring compliance with industry standards and regulatory requirements.
- Integrated Okta with AWS services for Single Sign-On (SSO) and multi-factor authentication (MFA), enhancing security and user management across applications.
- Configured Okta identity provider (IdP) settings for federated authentication with AWS IAM roles, enabling secure access to AWS resources.
- Integrated Okta with AWS services for Single Sign-On (SSO) and multi-factor authentication (MFA), enhancing security and user management across applications.
- Configured Okta identity provider (IdP) settings for federated authentication with AWS IAM roles, enabling secure access to AWS resources.
- Implemented Amazon Cognito for user authentication, authorization, and user management in web and mobile applications.
- Configured Cognito User Pools and Identity Pools to manage user identities and enable secure access to AWS resources.
- Integrated Cognito with AWS Lambda for custom authentication workflows and enhanced security measures.
- Involved in the development of test environments on Docker containers and configuring the Docker containers using Kubernetes.
- Developed microservice onboarding tools leveraging Python and Jenkins allowing for easy creation and maintenance of build jobs and Kubernetes deploy and services.
- Developed microservice onboarding tools leveraging Python and Jenkins allowing for easy creation and maintenance of build jobs and Kubernetes deploy and services.
- Experience in Deployment Automation & Containerization (Docker, Kubernetes).
- Added and removed software using Terraform script in our get repo
- Updated and changed our environment using YAML code stored in TerraForm
- Developed and deployed a ChatGPT model for customer service chatbot
- Fine-tuned the model to improve its performance on the specific task and industry
- Collaborated with cross-functional teams to integrate the chatbot with the company's systems and platforms
- Contributed to the research on the state-of-the-art language models and their applications
- Developed a language model to generate product descriptions for e-commerce website
- Trained and fine-tuned GPT-2 on a large dataset of product descriptions
- Implemented and evaluated several variations of the model using different techniques and approaches
- Presented the results and insights to the team and management
- Implemented DataDog APM for real-time monitoring and analysis of application performance.
- Configured custom metric tracking to monitor specific KPIs and business-critical transactions.
- Integrated DataDog APM with existing infrastructure and applications to gain end-to-end visibility into performance.
- Set up tracing and request correlation to understand the performance of microservices and distributed systems.

- Utilized log management capabilities to centralize and analyze log data in real-time.
- Automated the process of detecting anomalies and deviations in performance trends.
- Utilized the alerting and notification system to proactively resolve performance issues.
- Customized dashboards to display real-time performance data and provide insights into application behavior.
- Utilized integrations with popular technologies and tools to further enhance monitoring capabilities.
- Scaled the DataDog APM solution to meet the growing demands of the organization and its applications.
- Managed and optimized databases using Amazon RDS, Aurora, and DynamoDB, ensuring high performance, availability, and scalability.
- Implemented automated database backups, snapshots, and replication strategies to ensure data durability and quick recovery in case of failures.
- Configured DynamoDB Global Tables for multi-region, fully replicated, and highly available database deployments.
-

EDUCATION

Bachelor of Accounting and Information Systems

Michigan State University
