SUMMARY

Mathematics and Statistics graduate with a robust technical background and a keen interest in financial markets. Proficient in Python, MATLAB, and C/C++, with extensive experience in developing and optimizing algorithmic trading strategies. Skilled in quantitative analysis, statistical modeling, and financial mathematics. Demonstrates strong communication and problem-solving abilities, with a meticulous attention to detail.

EXPERIENCE

*William Paterson University of New Jersey, **Student Tutor***

Sep 2021 - Present

Simplified calculus, algebra, and statistics concepts in one-on-one and group tutoring sessions, enhancing students' comprehension and performance.

Applied mathematical reasoning to real-world scenarios, leading to a measurable improvement in students' understanding and academic results.

Supported students with practical learning strategies, resulting in a significant increase in their academic performance and confidence.

PROJECT, *Quantitative analysis of Trading Strategies for futures markets*

Jun 2022 - Present

Designed and optimized a fully-systematic trading framework that pinpoints high-probability entries and exits across four CME micro-contracts—Nasdaq-100 (MNQ), S&P 500, Russell 2000, and Micro Bitcoin (MBT). The engine:

Signal generation & risk controls – Combines multi-factor statistical filters with real-time volatility estimates to generate trade signals, then sets position-specific profit-taking limits for long trades and protective stops for short trades.

Parameter optimisation – Employs grid search and walk-forward analysis to tune limit/stop distances and position sizing, ensuring robustness in bullish, bearish, and sideways markets.

Back-test performance – two-year paper tests show consistent profitability: $\approx$ \$800 k annual P&L per 100-lot in MNQ and $\approx$ \$100 k per single MBT contract, while maintaining tight drawdown thresholds.

Tech stack – Core execution logic written in fast, vectorised Fortran; data ingestion, feature engineering, and reporting handled in Python/Excel and version-controlled with Git.

Next steps – Building the order-routing layer for live deployment and integrating machine-learning optimisers to further refine signal strength and risk metrics.

EDUCATION

William Paterson University

B.S. • Mathematics with Honors, Minor in Statistics • Sep 2020 - May 2025

GPA: 3.85

Relevant Coursework: Corporate Finance, Financial Accounting, Mathematical Modeling in Finance I & II, Probability, Data Analysis, Micro/Macro Economics

SKILLS

Python • MATLAB • C/C++ • Excel (Data Analysis) • Thinkorswim Script • Trading Platforms: Thinkorswim, Schwab, Robinhood, Coinbase • Mathematical Expertise: Statistical Modeling, Quantitative Analysis, Financial Mathematics • Soft Skills: Strong Communication, Problem-Solving, Collaboration

HONORS & AWARDS

Pi Mu Epsilon Nominee – National Mathematics Honor Society

Barbara M. Grant Scholar – Academic Excellence Recognition

Melvin Cebrik Math Scholar – Outstanding Mathematics Achievement

Marcelo Llarull Scholar – Excellence in Quantitative Studies
