

Reshma Danala

Full Stack Java Developer

reshma.d0124@gmail.com | +1 901-206-2850 | www.linkedin.com/in/reshma-danala-16549637a

SUMMARY

- Full Stack Java Developer with 8 years of experience building Java applications for banking, enterprise, and consulting projects.
- Strong hands-on experience with Java, Spring Boot, microservices, REST APIs, GraphQL, and Kafka-based systems.
- Experienced working across both relational and NoSQL databases, including Oracle, SQL Server, MySQL, MongoDB, DynamoDB, and Redis, for schema design, performance tuning, and caching.
- Built and maintained React and Angular frontends across teams of varying size, and comfortable taking a feature from API design through to UI when needed.
- Covered the full development cycle, from sprint planning to CI/CD pipeline setup in Jenkins and AWS cloud deployments.
- Handled post-release monitoring using Datadog and Splunk, with project-level exposure to Terraform for infrastructure provisioning.
- Recently helped modernize a legacy banking application into Spring Boot microservices with a zero-downtime cutover.
- Experience building secure, resilient services for banking applications, including audit logging, PII protection, and retry and timeout handling for downstream failures.
- Quick to understand existing codebases and worked closely with QA, DevOps, and product teams.
- Comfortable pairing with and mentoring newer developers on framework fundamentals as teams grew, alongside regular participation in code reviews.
- Supported production systems by troubleshooting issues, testing APIs, validating releases, and fixing defects with QA teams.
- Strong focus on test coverage and code quality, using JUnit, Mockito, Testcontainers, and SonarQube to catch issues before release.
- Leaned on tools like GitHub Copilot and Claude to speed up documentation, review code, and catch common issues earlier.
- Reduced page-load network calls from 7 to 1 and improved time-to-meaningful-content by 35% through a GraphQL API migration.

TECHNICAL SKILLS

Languages: J2EE/Java 8/11/17/21, SQL, JavaScript, TypeScript, Python

Java / Spring: OOPS, Spring Boot, Spring MVC, Spring Data JPA, Hibernate, Spring Batch, Spring Cloud, Spring Security, Spring Cloud Config, HikariCP, JDBC

APIs & Messaging: REST, GraphQL, JAX-RS, SOAP/JAX-WS, OpenAPI/Swagger, Apache Kafka, JMS, RabbitMQ, Resilience4j

Frontend: React, Angular, HTML5, CSS3, Bootstrap, Node.js

Cloud (AWS): EC2, Auto Scaling, ECS/Fargate, Lambda, S3, RDS, DynamoDB, VPC, IAM, SNS, SQS, CloudWatch

CI/CD & Infra: Jenkins, Docker, Kubernetes, Git, GitHub, Maven, Gradle, Terraform and AWS CloudFormation

Observability: Datadog, Splunk, Log4j

Databases: Oracle, MySQL, Amazon RDS, DynamoDB, SQL Server, MongoDB, Redis

Testing & Quality: JUnit 5, Mockito, Spring Boot Test, SonarQube, Testcontainers, Postman

AI-Assisted Development: GitHub Copilot, ChatGPT, Claude

Tools & Practices: JIRA, SDLC, Eclipse, IntelliJ, Agile/Scrum, Microservices, Event-Driven Architecture

PROFESSIONAL EXPERIENCE

Full Stack Java Developer

Willamette Valley Bank

Apr 2025 – Present

Salem, OR

- Built and maintained Spring Boot microservices handling high-concurrency banking transactions in a fully remote role, with Spring Security and OAuth 2.0 enforcing role-based access.
- Implemented persistence using Spring Data JPA/Hibernate and used JDBC with HikariCP for performance-critical queries; adopted Java 21 features to modernize backend logic and reduce boilerplate.
- Implemented Redis caching for low latency reads and session/token caching, reducing repeated database calls and improving API response times.
- Built a GraphQL aggregation layer combining data from multiple backend services, reducing frontend API calls from four separate REST requests to a single query for key screens.
- Set up and maintained Jenkins CI/CD pipelines covering builds, unit tests, SonarQube scans, Docker packaging, and deployment to AWS ECS, moving release cycles from weekly to on-demand; also supported Terraform work with the DevOps team for infrastructure provisioning steps in the pipeline.
- Contributed to AWS CloudFormation work for a log-monitoring setup and partnered with the DevOps team on Datadog dashboards to monitor service health across microservices, using CloudWatch for AWS-native resources such as Lambda logs, ECS task logs, and alarms during production troubleshooting.
- Engineered Kafka producers and consumers for real-time transaction events and integrated an SQS-based queue for asynchronous back-office processing with SNS notifications for operational alerts.
- Added OpenAPI annotations across Spring Boot REST endpoints and kept the documentation in sync as APIs changed, validating requests and responses through Swagger UI during development.

- Applied Resilience4j retry and timeout policies to calls from account services to downstream customer and transaction services, reducing the impact of temporary failures on users.
- Modernized a legacy Spring 4 application into Spring Boot microservices using Spring Cloud, coordinating a zero-downtime cutover during business hours.
- Added audit logging, PII masking, and idempotent retry logic to versioned REST endpoints based on requirements raised during a mid-project compliance review.
- Relied on GitHub Copilot and Claude to support documentation generation and flag common issues during pull request review, helping keep delivery velocity steady without sacrificing review quality.
- Wrote Python scripts to validate data consistency between legacy RDS instances and a new cloud-native schema during a migration window; managed schema versioning across dev, staging, and production.
- Developed React UI components and reusable hooks for customer-facing banking screens, integrating with GraphQL/REST APIs and improving UI consistency across modules.

Full Stack Developer Velocious Solutions

Oct 2022 – Dec 2024
Hyderabad, India

- Decomposed a Java monolith into Spring Boot microservices registered with Netflix Eureka, enabling independent releases and horizontal scaling by capability.
- Leveraged DynamoDB as a lightweight lookup and config store for low latency reads across multiple services.
- Migrated a REST monolith to a GraphQL-first API layer, cutting the average number of network calls per page load from 7 to 1 and reducing time-to-meaningful-content by 35%.
- Built and consumed JAX-RS RESTful APIs for core service integrations.
- Wrote lightweight automation scripts in Python and Node.js that cut weekly manual reporting effort by several hours per sprint.
- Configured AWS infrastructure to support a multi-environment deployment model across dev, staging, and production accounts; used Datadog dashboards to monitor service health and surface latency/error trends.
- Owned MongoDB schema design, index strategy, and replication setup; used AI-assisted analysis on slow-query logs to identify missing compound indexes, resolving a recurring performance issue on a high-volume collection.
- Ran MongoDB integration tests with JUnit 5, Mockito, and Testcontainers, giving developers an isolated database to test against instead of relying on shared environments.
- Built React features using reusable components and hooks, implementing state management and performance optimizations for responsive, data-heavy workflows.
- Configured Kafka with SSL and set up consumer groups for two event-driven integrations; tracked down and resolved a recurring consumer lag issue causing intermittent processing delays in production.
- Introduced Docker and Kubernetes to replace a fragile shell-script deployment process, giving the team consistent local dev parity with production.
- GitHub Copilot and ChatGPT are used in day-to-day development to speed up boilerplate coding and documentation updates, validating output against project standards before merge.

Full Stack Developer Unisys Global Services India

Jan 2021 – Sep 2022
Hyderabad, India

- Developed Java and Spring Boot services with Spring Cloud Config for centralized, environment-specific configuration management across a suite of close to a dozen interconnected applications.
- Built event-driven processing services using Spring Boot and Apache Kafka; implemented JMS producers and consumers to bridge a legacy queue-based integration during the transition.
- Implemented API gateway routing and load balancing with Spring Cloud Gateway and Zuul, including circuit-breaker patterns to handle downstream service failures gracefully.
- Wrote multi-threaded batch jobs using Java concurrency APIs to process large data files within agreed SLA windows.
- Developed React components for internal dashboards, integrating with Spring Boot APIs and handling client-side validation and error states.
- Migrated the AngularJS frontend to Angular, modernizing the component model and enabling the team to use typed reactive forms and the Angular CLI toolchain.
- Set up AWS EC2 Auto Scaling groups and VPC networking for a workload that had previously been running on a single fixed instance.
- Worked closely with QA and business analysts during sprint cycles to clarify requirements early and cut down on backlog churn on user stories.
- Took part in regular code reviews and paired with newer team members on Spring Boot fundamentals as the team grew.

Full Stack Developer DevRabbit

Mar 2019 – Dec 2020
Hyderabad, India

- Built Spring Boot features and Spring Batch jobs for scheduled file processing and report generation, with Oracle as the backing database.
- Helped integrate legacy SOAP/JAX-WS endpoints as part of a broader platform modernization push.
- Brought in RabbitMQ for async messaging between two services, cutting down on direct service-to-service dependencies.
- Applied Java 8 features such as lambdas, the Stream API, and Optional consistently, cutting down on boilerplate null checks that had built up over time.
- Built React-based UI screens with responsive layouts using Bootstrap and CSS3; added AJAX-driven interactions to cut down on server round trips on form-heavy screens.

- Wrote JUnit tests and took part in code reviews, which helped the team settle on a baseline test coverage goal we tracked sprint over sprint.
- Managed source control and release tagging in Git, kept JIRA stories aligned with deployment branches, and maintained Jenkins jobs for build automation.
- Worked directly with QA during regression cycles, using Postman to validate API requests and responses while triaging and fixing defects before each release, which helped keep release dates predictable.
- Partnered with a senior DBA to troubleshoot slow report-generation jobs, which helped build early Oracle tuning experience.

Java Developer

Pranathi Software Services

Jun 2017 – Feb 2019

Hyderabad, India

- Started as an entry-level full stack developer working on Java/Spring MVC bug fixes and small feature enhancements while learning from senior developers.
- Built and consumed basic REST APIs in Spring Boot and helped with simple UI screens (HTML/CSS/JavaScript), focusing on form validation, usability fixes, and consistent API contracts.
- Helped with authentication and authorization updates in Spring Security under senior guidance, learning the framework hands-on while implementing and testing changes.
- Supported deployments to AWS EC2 and helped maintain Maven builds; got early Docker exposure running services locally in containers for consistent dev setups.
- Maintained Oracle database schemas, wrote SQL queries and stored procedures, and added Log4j instrumentation to track down intermittent issues that came up under load.
- Supported Angular UI enhancements by implementing reusable components, form validations, and service-based API integration.
- Participated regularly in sprint planning and daily stand-ups, building early experience with Agile delivery practices.
- Improved existing applications by fixing bugs, making small enhancements, and becoming familiar with established codebases.

EDUCATION

Bachelor's in computer science

B.V. Raju Institute of Technology (BVRIT), Hyderabad, India | Sep 2013 – May 2017
