EDUCATION

B.S. COMPUTER SCIENCE

Pennsylvania State University
University Park, PA

COMPETENCIES

Public Speaking
Time Management
Conflict Resolution
Attentive to Detail
Critical Thinking
Cultural Consciousness
Risk Mitigation
Delegation
Prioritization
Pragmatism

PROFICIENCIES

Python
Data Cleaning
Data Visualization
Data Structures
Database Management
Artificial Intelligence
Machine Learning
Optimization
Multithreading
Pandas
NumPy
SciKit-Learn
SciPy
MatPlotLib
Seaborn
Version Control

SUMMARY

Computer Science Bachelor with strong technical proficiency in data analysis and software development. Practical experience in developing products in Python and C#, as well as producing data analysis trends and patterns via a variety of machine learning techniques. Trustworthy team player who thrives in collaborating with diverse skill sets and cross functional teams. Motivated quick learner with a strong work ethic and excellent communication skills. Adaptable to new environments and emerging technologies.

CORE COMPETENCIES:

- Technical Communicator: Capable of effectively translating complex technical concepts into easily understandable terms and tailoring communication to various audiences, including both non-technical and technical teams
- Team Player: Cultivator of strong working relationships and demonstrating leadership capabilities when needed to create a collaborative and inclusive work environment.
- Adaptable: Quick learner with a flexible mindset, adept at acquiring new technologies, programming languages, and methodologies to stay current with evolving industry

EXPERIENCE:

DataAnnotation.Tech

December 2023 - Current

- Test and analyze AI models as coding assistants, ensuring their code functioned and the information they provide is correct.
- Verify the findings and insights generated by the models by analyzing data and corroborating the results with Python.

MAIN PROJECTS:

Data Analysis:

- Collected and processed data from more than 200 videogame matches in Excel, utilizing JupyterLab, Pandas, Matplotlib, and NumPy for effective data manipulation and visualization.
 - Conducted Pearson correlation analysis to identify significant relationships and offered insightful explanations for observed correlations for performance between the five game types.
 - Collected 500 data points to create a model through Machine Learning to read the input data and predict the outcome of the match.
- Collected and processed more than 10000 comments from a public forum, constructing multiple N-Gram language models and generated new sentences using said models.
 - Implemented multithreading to reduce time spent developing models by over 70% versus process utilization of single thread.
- Wrote a script collecting approximately 350 rows of data per day from a public website and a desktop application to visualize the data over time.
 - Runs through several webpages and uses XPath to collect all relevant data.
 - The accompanying application displays a line graph showing all selected data and how it evolves over time with a modern UI and a distinct chart.
- Analyzed a dataset of 973 entries detailing gym members' habits utilizing JupyterLab, Pandas, Matplotlib, and Seaborn.
 - Categorized age data into three demographic groups for easier analysis.
 - Designed heat maps to show the proportion of work out types by age group for each gender.
 - Created a bar chart to compare the average calories burned over session length by work out type for insight into efficiency.
