SUMMARY

Software Engineer with a background in backend development and machine learning. Skilled in Python, Java, C, and cloud-based systems (AWS, Firebase), with hands-on experience building scalable applications and data pipelines. Strong foundation in algorithms, system design, and collaborative software development within Agile team environments.

SKILLS

Languages: Python, Java, JavaScript, C, SQL, R, Dart, HTML, Assembly

Frameworks & Libraries: Pandas, NumPy, Scikit-learn, TensorFlow, React*, React Native* (Beginner)

Databases & Cloud: AWS (S3), MySQL, Firebase (Auth, Firestore, Cloud Functions)

Tools & Platforms: Git, GitHub, Linux, Jupyter Notebook, Excel, IntelliJ

Specialties: Artificial Intelligence, Machine Learning, Backend Integration, Data Visualization, Sentiment Analysis, NLP, CI/CD

EDUCATION

Augustana College | Bachelors in Computer Science | GPA: 3.3/4.0 Graduation May 2025

- **Relevant Classes:** Principles of Artificial Intelligence, Machine Learning Principles, Algorithms and Computational Theory, Statistical Learning, Principles of Computer Systems, Game Development, Software Development, Data Science, Intro to MIS
- **Varsity Swim Team**

PROJECTS

All projects available on my Github

Flutter Fitness App

Designed a cross-platform mobile app in Flutter to help users track workouts, set goals, and view progress charts. Integrated Firebase Authentication (Google Sign-In) and Firestore for real-time storage of user profiles, exercise logs, and personal bests. Enabled coaches to track athletes' goals, workouts, and attendance.

NBA MVP Prediction Model (Machine Learning)

Collected and cleaned 10+ years of NBA player statistics using Python/pandas and engineered features of team and personal metrics and applied feature scaling and normalization techniques. Trained a RandomForest classifier to predict MVP candidates and achieved 93% accuracy on test seasons. Correctly predicted the NBA 2025 MVP beforehand.

Sentiment Analysis of Text Data (R)

Conducted sentiment analysis on a large text dataset by applying Bing and NRC lexicons to classify polarity and emotional categories (joy, anger, fear, etc). Used R to preprocess data, generate word clouds and trend visualizations, and highlight key sentiment drivers, using applied NLP techniques.
