

HEALTHCARE RESEARCH DATA ANALYST

Real-World Evidence • Healthcare Research • Secondary Data Analytics

LOCATION Remote (U.S.)	EMPLOYMENT TYPE Contract – W2	DURATION 18–24 months
ANTICIPATED START October 20, 2026	REPORTS TO Manager, Real-World Evidence & Research Data	COMPENSATION \$42.85–\$50.20/hr, based on experience

01 ROLE OVERVIEW

This role supports research teams working with real-world healthcare data. The analyst will prepare and assess secondary datasets, perform structured Excel-based analysis, investigate data-quality issues, and turn findings into concise research-ready summaries. The position is designed for an early-career analyst with a public health, clinical, pharmacy, epidemiology, or life-sciences foundation.

02 WHAT YOU WILL OWN

DATA PREPARATION

Organize, reconcile, and quality-check multi-source healthcare datasets before analysis.

ANALYSIS

Perform descriptive and secondary-data analysis on de-identified, population-level, or country-level datasets.

DATA QUALITY

Trace missing values, inconsistencies, outliers, duplicates, and definition mismatches; document findings for review.

EXCEL ANALYTICS

Use Excel for cleaning, formulas, lookups, structured summaries, trend analysis, and research tables.

RESEARCH SUPPORT

Apply basic epidemiology/biostatistics concepts to examine clinical, demographic, environmental, or utilization variables.

DOCUMENTATION

Maintain data definitions, processing notes, assumptions, source references, and reproducible analysis documentation.

COMMUNICATION

Convert analytical findings into clear summaries for researchers, clinical stakeholders, and non-technical audiences.

AD HOC DELIVERY

Respond to data requests, literature-review needs, and quality-improvement activities while meeting research timelines.

03 CORE QUALIFICATIONS

The requirement is intentionally focused on research/data fundamentals rather than advanced software engineering. Candidates should demonstrate the ability to work carefully with healthcare data and explain what their analysis means.

- ✓ Bachelor's/Master's degree in Public Health, Pharmacy, Epidemiology, Biostatistics, Health Sciences, Data Analytics, or a related discipline; MPH, PharmD, or equivalent advanced study is a strong plus.
- ✓ Hands-on exposure to healthcare, public-health, clinical, life-sciences, or population-health datasets through professional work, internship, academic research, thesis, or capstone experience.
- ✓ Practical Excel capability: data cleaning, formulas, lookups, conditional logic, pivot tables, structured reporting, and basic quantitative analysis.
- ✓ Working understanding of epidemiological or biostatistical concepts and how variables, cohorts, outcomes, and denominators affect interpretation.

- ✓ Strong written communication and documentation habits; able to explain a data issue or finding without overcomplicating it.
- ✓ Comfort working independently in a remote environment with deadlines, review cycles, and changing research requests.
- ✓ Authorized to work in the U.S. for the full engagement; no sponsorship is available.

04 PREFERRED RESEARCH EXPOSURE

R / SAS	Global Health	Research Ethics	Clinical Ops	Research Writing
Developing proficiency	WHO / multi-country data	CITI / human-subjects training	QI / documentation	Literature synthesis / thesis

05 INTERVIEW PROCESS

The process is structured to evaluate research fundamentals, healthcare-data judgment, communication, and practical analytical ability. Exact timing may vary by hiring schedule.

06 FIRST 90 DAYS

0–30 DAYS	31–60 DAYS	61–90 DAYS
Learn the data environment Understand source datasets, definitions, reporting standards, research workflows, and quality-control expectations.	Own recurring checks Independently complete assigned data-quality checks, structured Excel analysis, documentation, and issue escalation.	Contribute with less review Deliver reliable research summaries, respond to routine data requests, and reduce rework through stronger documentation and analytical judgment.

07 WORKING STYLE & SUCCESS PROFILE

Strong fit looks like: careful with definitions • comfortable asking why a number changed • able to trace a discrepancy to its source • concise in written communication • disciplined with documentation • confident presenting a finding without overstating it.

This is a research-data role first: accuracy, analytical reasoning, healthcare context, and clear communication matter more than an extensive programming stack.
