ASSIGNMENT TYPE	W2 Contract — staffing-partner submission
INITIAL ASSIGNMENT / END	12 months Projected end September 27, 2027
EXTENSION	Subject to project/business need and performance
WORK MODE	Onsite / client-directed schedule
CLIENT COMPENSATION REFERENCE	\$78,720–\$131,160 published annual range

Macy's currently publishes a Business Intelligence & Digital Analyst position in New York, explicitly focused on dashboards, SQL, data pipelines/dependencies, digital performance reporting, data validation, and translating business questions into analytical solutions.

★BUSINESS REQUIREMENT

Macy's Digital Analytics organization is responsible for providing business teams with reliable performance information across the company's digital organization. This assignment sits at the intersection of business analytics, reporting, and data operations — understanding what a business team is trying to measure, identifying where the underlying data originates, validating the numbers, and delivering a dashboard or report business stakeholders can use.

The current Macy's posting describes the analyst as the hands-on technical engine supporting dashboards and reporting used by business analysts and department heads — calling specifically for SQL, dashboard development, data-dependency mapping, metric operationalization, and reporting QA.

★WHAT THE ANALYST WILL OWN

01 — Reporting

- Develop/maintain business dashboards (Tableau and/or Power BI); build recurring digital-performance reporting views
- Ensure consistent definitions and validated metrics; modify reports as requirements or metric definitions change

02 — Data Analysis

- Write SQL to extract/transform analytical information; validate data across multiple sources
- Investigate unexpected metric changes; trace dashboard values to source data; flag quality issues before they reach stakeholders

03 — Business Requirements

- Meet with business users to understand the question behind a request; translate requirements into KPIs and analytical logic
- Document metric definitions/reporting requirements; coordinate with BI/engineering partners on source-data changes

04 — Digital Performance

- Analyze digital performance trends across business segments; flag unusual movements in traffic, transactions, or customer activity
- Prepare concise, data-backed findings and support recurring performance reviews

05 — Data Operations / QA

- Map reporting-dataset-to-source-system relationships; validate outputs after data or logic changes; reconcile reporting-layer discrepancies
- Maintain documentation supporting reporting logic and data dependencies; support business users with self-service reporting

06 — Cross-Functional Delivery

- Partner with analytics, engineering, product, and business teams; communicate data limitations and assumptions clearly
- These responsibilities closely follow Macy's current published Business Intelligence & Digital Analyst scope.*

★QUALIFICATIONS

REQUIRED	PREFERRED
- Bachelor's in Computer Engineering, Business Analytics, Information Systems, Statistics, Mathematics, or related quantitative discipline - Strong working knowledge of SQL; demonstrated experience analyzing structured business data - Experience creating dashboards or analytical reports; working knowledge of Tableau or Power BI - Strong Excel capability; ability to investigate discrepancies and validate analytical outputs - Ability to translate business questions into measurable analytical requirements - Strong attention to data accuracy; ability to communicate conclusions to technical and non-technical stakeholders	- Python/Pandas; experience with large datasets; ETL/data-preparation exposure - Digital/e-commerce analytics exposure; customer segmentation; A/B testing - Familiarity with Adobe Analytics or comparable digital analytics platforms - Experience documenting data flows or metric definitions - Experience working with BI engineers or data teams

Macy's published requirements specifically call for strong SQL, large-scale data warehouses, Tableau/Power BI/Adobe Analytics/Excel, tracing dashboard data to source databases, data accuracy, and collaboration with BI engineers.
