

Data Analyst

American Express • Phoenix, Arizona • On-Site

Employment Type	W2 - Contract-to-Hire (C2H)
Desired Start Date	October 13, 2026
Work Arrangement	On-Site
Experience	2-5 Years
Compensation	\$70,000-\$85,000 annually
Compensation Discussion	Confidential / open to discussion on call

Position Overview

American Express is seeking a Data Analyst to support data-driven business and operational initiatives within its Phoenix organization. The role is suited for an analyst who can work comfortably with structured business data, investigate data-quality issues, develop recurring reporting, and translate analytical findings into information that business and operational teams can act upon.

The position will involve working with data used for business performance, customer-related operations, risk management, controls, and reporting. This is an on-site Phoenix assignment, requiring regular collaboration with analysts, business stakeholders, technology teams, and operational partners.

Key Responsibilities

Data Analysis & Business Reporting

- Analyze structured datasets to identify trends, exceptions, performance changes, and data-quality issues relevant to assigned business functions.
- Translate business questions into clearly defined analytical requirements, datasets, measures, and reporting outputs.
- Perform detailed data validation before releasing recurring reports, dashboards, or analytical findings to stakeholders.
- Investigate unexpected changes in business metrics by tracing source data, transformation logic, filters, and reporting calculations.
- Prepare recurring and ad-hoc analyses to support operational reviews, management reporting, and business decision-making.
- Develop clear summaries of analytical findings, including the underlying data, methodology, key observations, and business implications.

SQL & Data Extraction

- Write and maintain SQL queries to retrieve, join, filter, aggregate, and validate data from enterprise data sources.
- Work with relational datasets containing customer, account, transaction, operational, risk, or performance-related information, depending on the assigned business area.

- Reconcile data across multiple sources and investigate differences between source records and downstream reports.
- Optimize frequently used queries where appropriate by reviewing joins, filters, aggregations, and unnecessary data retrieval.
- Create reusable queries and analytical datasets that support recurring reporting and operational analysis.
- Document important query logic, data definitions, assumptions, and validation procedures.

Data Quality & Controls

- Perform completeness, accuracy, consistency, and exception checks on analytical datasets.
- Identify duplicate, missing, inconsistent, or unexpected records and coordinate with appropriate teams to determine root causes.
- Maintain documented validation procedures for recurring reports and analytical outputs.
- Support data-control activities by maintaining evidence of checks, reconciliations, issue resolution, and reporting changes.
- Escalate material data discrepancies and reporting issues through established business and technology processes.
- Help ensure that analytical outputs follow applicable internal data-management, privacy, security, and control requirements.

Analytics Supporting Risk & Business Operations

- Customer and account performance analysis.
- Transaction and operational trend analysis.
- Risk and control reporting.
- Fraud-related or anomaly-focused analytical investigations.
- Business performance and productivity reporting.
- Exception monitoring and root-cause analysis.
- Management reporting and operational scorecards.
- Data used to support customer and business decisions.

Dashboard & Visualization Support

- Build or maintain business-facing dashboards and reporting views using approved visualization tools.
- Convert analytical results into concise visualizations that allow stakeholders to monitor trends, exceptions, and key performance indicators.
- Validate dashboard calculations against source data before publication.
- Work with business users to refine reporting requirements and improve the usefulness of existing dashboards.
- Maintain appropriate documentation for metric definitions and reporting logic.

Stakeholder & Cross-Functional Collaboration

- Work directly with business stakeholders to understand reporting needs and analytical questions.
- Participate in working sessions to clarify requirements, review findings, and resolve data-related questions.
- Communicate analytical findings clearly to both technical and non-technical audiences.
- Partner with data engineering, technology, risk, operations, and reporting teams when issues require cross-functional investigation.
- Track assigned analytical deliverables, dependencies, open questions, and outstanding data issues through completion.
- Present findings in a concise, business-oriented manner rather than simply delivering raw data.

Required Qualifications

- 2-5 years of professional experience in data analysis, business intelligence, reporting, analytics, or a closely related discipline.
- Bachelor's degree in Computer Science, Information Systems, Statistics, Mathematics, Business Analytics, Engineering, Finance, or a related quantitative field.
- Strong hands-on SQL experience, including joins, aggregations, filtering, subqueries, and data validation.
- Strong Microsoft Excel skills, including PivotTables, lookups, conditional logic, data validation, and analytical reporting.
- Experience analyzing large or structured datasets and identifying trends, exceptions, and inconsistencies.
- Experience creating recurring reports, dashboards, or analytical deliverables.
- Demonstrated ability to investigate data discrepancies and identify potential root causes.
- Strong attention to detail when working with business-critical data.
- Ability to document analytical logic, assumptions, methodologies, and findings.
- Strong written and verbal communication skills.
- Ability to work effectively in an on-site, cross-functional enterprise environment.

Preferred Qualifications

- Experience within financial services, payments, banking, credit, risk, fraud, or other regulated industries.
- Experience working with customer, account, transaction, or operational datasets.
- Exposure to risk analytics, fraud monitoring, compliance reporting, or control-related analysis.
- Experience with Tableau, Power BI, or a comparable enterprise visualization platform.
- Working knowledge of Python or another analytical programming language.
- Experience working with cloud-based or enterprise data platforms.
- Familiarity with data governance, data privacy, access controls, or enterprise data-quality practices.
- Experience supporting analytical projects involving multiple business and technology stakeholders.

Technical Skill Set

Required	Preferred
SQL	Python
Microsoft Excel	Tableau / Power BI
Data Analysis	Statistical Analysis
Data Validation	Data Visualization
Data Reconciliation	Enterprise Data Warehousing
Reporting	Risk/Fraud Analytics
Data Quality Analysis	Data Governance
Business Requirements Analysis	

Project Environment

The analyst will operate in an enterprise environment where analytical outputs may support customer-facing operations, business performance, risk management, controls, and internal decision-making. The position requires disciplined handling of data, repeatable validation procedures, and clear documentation because analytical results may feed downstream reporting and business processes.

The Phoenix assignment is designed for an analyst who is comfortable moving between SQL-based data investigation, Excel/reporting work, data-quality checks, stakeholder discussions, and business-focused analysis rather than working exclusively on dashboard development.

What Success Looks Like

- Delivering accurate recurring and ad-hoc analytical reports on schedule.
- Producing SQL queries and analytical datasets that can be validated and reused.
- Identifying and escalating meaningful data-quality issues before they affect reporting.
- Reducing manual reconciliation and repetitive reporting work where automation is practical.
- Providing stakeholders with clear explanations of trends, exceptions, and analytical findings.
- Maintaining reliable documentation for reporting logic and data-validation procedures.
- Working effectively with business and technology teams to resolve data issues and complete assigned deliverables.

AMERICAN EXPRESS

Contract Details

Position	Data Analyst
Client	American Express
Location	Phoenix, Arizona
Work Arrangement	On-Site
Employment Type	W2 - Contract-to-Hire
Experience	2-5 Years
Desired Start Date	October 13, 2026
Compensation	\$70,000-\$85,000 annually
Compensation Basis	Negotiable based on relevant experience, technical skills, and project fit
Compensation Discussion	Confidential and open to discussion on call

Employment Consideration

The assignment is structured as a W2 Contract-to-Hire opportunity, with the initial engagement followed by consideration for longer-term employment based on business requirements, performance, project needs, and applicable employment terms.

Recruiting Note: Compensation is confidential and open to discussion on call. The source JD specifies an on-site Phoenix assignment and a desired start date of October 13, 2026.
