

DIGITAL PLATFORM ENGINEER

FULL STACK / API SERVICES

CLIENT	Comerica Bank
ROLE	Digital Platform Engineer — Full Stack / API Services
CLIENT REQUISITION ID	To be populated from the active staffing-system requisition; not publicly disclosed
CONTRACT TERM	18 Months
START DATE	Last week of September 28, 2026
PROJECTED END DATE	March, 2028
EXTENSION	Possible, subject to project funding, delivery milestones and continued business requirement
PRIMARY LOCATION	Richardson, Texas
C2H POSSIBILITY	Yes
WORK MODEL	Hybrid
EMPLOYMENT TYPE	W2 Contract
SCHEDULE	Standard business hours, Monday-Friday

WORK AUTHORIZATION

Acceptable employment authorization may include:

- U.S. Citizen
- Green Card / Permanent Resident
- OPT / STEM OPT where legally authorized
- H-4 EAD
- H-1B transfer candidates where the staffing employer is able to act as the H-1B petitioner and the transfer is legally supportable

Note: All candidates remain subject to Form I-9, employment eligibility verification, client/vendor compliance and applicable immigration requirement.

W2 COMPENSATION AND BENEFITS

W2 RATE \$58 - \$64 / hr	BENEFITS INCLUDE • Medical insurance • Dental insurance • Vision insurance • 401(k) with company match • Paid time off and company holidays • Professional development and certification support
---	--

Final rate is determined by experience, technical level, staffing-company compensation structure and client-approved rate.

ASSIGNMENT

This position supports Comerica's application and technology environment in the Dallas–Richardson market. The engineering team works on enterprise applications and services where application functionality, API integrations, data processing and database reliability have to operate together within a regulated financial-services environment.

The engineer will spend a significant portion of the engagement working on API services, data movement, database logic and integration points while contributing to application-layer functionality when required.

The successful contractor will be expected to take a user story or technical requirement through development, testing and deployment, work with existing enterprise services rather than build isolated applications, and troubleshoot production issues with an understanding of both application behavior and underlying data.

PRIMARY RESPONSIBILITIES

- Develop and maintain full-stack application functionality across backend services, APIs, database components and application interfaces.
- Build and maintain RESTful APIs and service integrations using Python or an equivalent enterprise programming language.
- Develop application logic supporting internal banking workflows and business processes.
- Write complex SQL queries, stored procedures and data-access logic against relational databases.
- Work with PostgreSQL, MySQL, SQL Server or comparable enterprise relational platforms as required by the assigned application.
- Develop data-processing and integration workflows that move information between application services and enterprise data platforms.
- Troubleshoot API failures, database issues, data inconsistencies and application defects across development and production environments.
- Support AWS-based application components, including services such as EC2 and S3, with additional cloud exposure considered relevant.
- Work with existing front-end components and contribute to UI/API integration using JavaScript/TypeScript and a modern framework where required.
- Participate in code reviews and follow established branching, pull-request and release procedures.
- Write unit and integration tests for new functionality and regression scenarios.
- Work with QA engineers to reproduce defects and determine whether an issue originates in application logic, API integration, database processing or upstream/downstream data.
- Participate in CI/CD activities and support controlled deployments through development, QA and production environments.
- Monitor application behavior and use logs, metrics and database diagnostics to investigate production incidents.
- Maintain technical documentation for APIs, data flows, application changes and operational procedures.
- Work directly with business analysts, product owners, QA, application support and other engineering teams during implementation.
- Participate in Agile ceremonies and provide realistic development estimates for assigned stories.
- Follow Comerica security, change-management, coding and production-release standards applicable to the application.

REQUIRED QUALIFICATIONS

The following are required for submission:

- 1-3 years of professional software/application development experience.
- Strong programming experience with Python or another production-grade backend language.

- Strong SQL and relational database experience.
- Hands-on REST/API development and integration experience.
- Experience working with application data across multiple systems.
- Experience with AWS or another enterprise cloud environment.
- Experience with Git and collaborative software-development practices.
- Experience troubleshooting production application or data issues.
- Understanding of application security, authentication and controlled access to enterprise systems.
- Ability to work in a regulated enterprise environment where development, testing, change control and production release processes are documented and enforced.
- Bachelor's degree in Computer Science, Information Technology, Engineering or related field, or equivalent experience.

PREFERRED QUALIFICATIONS

- Experience in banking, financial services, payments, lending, risk, treasury or another regulated financial-services environment.
- Experience with JavaScript/TypeScript and React, Angular or comparable UI technology.
- Experience with AWS EC2, S3, RDS or comparable cloud services.
- Experience with ETL, data pipelines or enterprise data integration.
- Experience with PostgreSQL, MySQL, SQL Server or MongoDB.
- Experience with Docker and CI/CD.
- Exposure to Azure data services or hybrid AWS/Azure environments.
- Experience with automated testing and API testing tools.
- Experience working with Jira, Confluence or comparable Agile delivery tooling.

INTERVIEW / SELECTION PROCESS

1. Comerica Engineering
2. Hands-On Technical Discussion
3. Engineering Manager
4. Client Finalization

The number or order of client interviews may change based on the hiring manager and the specific application team.
