

CLOUDTRUCKS

Data Scientist — Logistics Intelligence & Machine Learning

W2 CONTRACT / HYBRID / SAN FRANCISCO

ENGAGEMENT

TERM 18 Months	START Oct 26, 2026	END 2028	RATE \$55–\$68/hr W2
MODE Hybrid	LOCATION San Francisco, CA	EXTENSION No	WORK AUTH. Valid US EAD

01 CONTEXT

CloudTrucks runs a technology platform for owner-operators and small trucking carriers. It covers load booking, dispatch, payments, compliance, and business management.

This Data Science role uses transportation, driver, load, and marketplace data to help Product and Operations make better decisions. The work is practical and production-focused, not research-only.

PRODUCTION FOCUS

Load recommendations • Schedule optimization • Operational forecasting • Product-behavior measurement

02 OWNERSHIP

MODEL & DATA

- Build and test predictive models using transportation, load, driver, customer, and operational data.
- Create features from load history, pricing, routes, driver preferences, utilization, and outcomes.
- Support ranking and recommendation work for load selection and driver-facing product decisions.
- Measure model results against business KPIs such as revenue opportunity, utilization, booking behavior, and operational efficiency.
- Use leakage-safe training, validation, and holdout methods.

PRODUCTION & IMPACT

- Compare baseline statistical or ML methods with tree-based models and explain the trade-offs.
- Use Python and SQL for analysis, feature engineering, model development, and validation.
- Use explainability methods when Product or Operations teams need to understand model results.
- Work with engineers to move validated models into production scoring or data workflows.
- Watch model performance after release and investigate drift, degradation, or unusual business behavior.
- Design experiments to see whether model-driven product changes improve business results.

03 NON-NEGOTIABLES

- Bachelor's or Master's degree in Data Science, Computer Science, Statistics, Business Analytics, Mathematics, or a related quantitative field.
- 1–3 years of hands-on Python data science experience, or equivalent graduate-level project experience.
- Strong Python skills with Pandas, NumPy, and Scikit-learn.
- Strong SQL skills for joining, aggregating, and analyzing production-style datasets.
- Experience building and validating supervised machine-learning models.
- Understanding of feature engineering, model evaluation, cross-validation, and holdout testing.
- Experience with regression, classification, or gradient-boosting methods.
- Ability to explain model results to non-technical Product or Operations stakeholders.
- Git/GitHub experience and comfort working with engineering teams.

04 DIFFERENTIATORS

- XGBoost or another gradient-boosting framework.
- SHAP or another model-explainability method.
- Recommendation, ranking, optimization, marketplace, or logistics experience.
- Experimentation / A-B testing and KPI measurement.
- dbt, Airflow, or cloud data platform experience.
- Transportation, freight, marketplace, or supply-chain analytics experience.

07 SUBMISSION / work authorization

Candidates must have valid U.S. work authorization for the assignment. The requirement lists Valid US EAD.
