SUMMARY

Full-stack engineer with 3+ years of professional experience building enterprise web applications and integrations end to end, from data model through REST API to modern front-end UI. Hands-on experience integrating LLM services into production applications and using AI coding agents as a daily development practice rather than an occasional accelerant. Comfortable working across enterprise systems and boundary integrations, and communicating with both technical and non-technical stakeholders.

TECHNICAL SKILLS

AI Development: Claude Code, Cursor, GitHub Copilot; OpenAI and Anthropic LLM APIs, prompt engineering, LLM-backed service integration in production, structured output design and validation

Development: JavaScript, TypeScript, Node.js, Java, Spring Boot, Python, FastAPI, REST API design, GraphQL, microservices, event-driven architecture (SQS/SNS)

Front End: Angular, React, Next.js, TypeScript, HTML5, CSS3, REST API consumption, reusable component libraries, WCAG 2.1 Accessibility

Databases: Oracle, PostgreSQL, SQL Server, MongoDB, Redis, relational data modeling, schema design and migration, query performance tuning

Cloud & Containers: Docker, Kubernetes, Microsoft Azure, AWS (Lambda, S3, SQS/SNS), CI/CD, GitHub Actions, Git

Testing & Practices: Jest, JUnit, Selenium, unit and integration testing, Agile/Scrum, code review, production support and monitoring (Prometheus)

PROFESSIONAL EXPERIENCE

General Motors | Chandler, AZ

Oct 2020 – Oct 2023

Full-Stack Software Developer

- Designed and built full-stack application features end to end for an enterprise platform used daily across the engineering organization: data models, REST APIs, and modern front-end UI.
- Consulted on architecture and design for the replacement of three disconnected legacy applications, integrating with boundary systems and consolidating them into a single cloud-native platform on Azure; cut infrastructure costs 30% and improved reliability 40%.
- Built Node.js and Java/Spring services and REST APIs supporting high-volume data ingestion, improving retrieval speed 30% and reducing response time 25% through query optimization and caching.
- Traced and resolved data flow issues across legacy Oracle-backed systems and custom web applications, identifying both technical and process improvements along the way.
- Provided guidance on production issues and built Prometheus monitoring dashboards that surfaced problems before users reported them.
- Partnered with project managers, business analysts, and internal stakeholders to gather requirements and translate them into working software, communicating technical tradeoffs to non-technical audiences.
- Wrote and maintained automated test suites (JUnit, Selenium) integrated into CI/CD pipelines, reducing regressions and accelerating release cadence 50%.

AI & OPEN SOURCE PROJECTS

AI Copyright Detection Tool

Mar 2024

- Integrated OpenAI LLM services into a production serverless application to detect content duplication and IP violations, using prompt engineering and response-side validation to get consistent structured output from a non-deterministic model.
- Built on AWS with S3, Lambda, and CI/CD, including audit logging and data privacy guardrails around LLM usage.

AI-Powered Sales Automation Platform

Mar 2025

- Built a cloud-native platform end to end: event-driven microservices on AWS using message queues for async processing, with FastAPI, Redis caching, PostgreSQL, and a Next.js and React front end.
- Designed AI-driven insight and lead scoring services integrated into operational workflows.

Wozz | Kubernetes Cost Optimization (Open Source, MIT)

Dec 2025 – Jan 2026

Contributor | github.com/WozzHQ/wozz

- Contributed merged code to an open-source Kubernetes toolchain, using Claude Code to orient in an unfamiliar codebase before making changes. Includes a GitHub Action that comments resource cost impact on pull requests.

EDUCATION

Arizona State University | Tempe, AZ

May 2020

Bachelor of Science, Computer Science
