

Shubham Mishra

shubhamm@bu.edu | 781-692-0033 | <https://www.linkedin.com/in/shubham-mishra-80b5b0178/>

Summary

Skilled and enthusiastic hard worker with almost 3 years of experience in the Software Engineering and Development field. Strong backend knowledge with hands-on experience on C#, NodeJs, Java and adding to the same with AngularJs for frontend. Possess sound technical knowledge in dealing with MSSQL, Vertica, MongoDB and PostGreSQL databases. Delivering quality with extending collaborations, leadership, management and communication skills.

Education

Master's in Computer Science | Boston University | Boston, MA Expected Graduation: December 2023

GPA: 3.91 / 4

CourseWork: Data Science with Python, Artificial Intelligence, Software Quality Management and Testing, Advanced Programming Techniques, Web Development, Backend with NodeJs Development, Computer Language Theory, Computer Networks

Bachelor of Technology in Computer Science | SRM University | Haryana, India

Year: 2015-2019

GPA: 7.47 / 10

CourseWork: Database Management Systems, Design and Analysis of Algorithm, Java Programming, Operating Systems, Compiler Design

Technical Skills

Frontend Languages: HTML5, CSS3, Bootstrap, AngularJs(Basic), JavaScript, Ajax

Backend Languages: Python, C#, Java, NodeJs, ExpressJs, R, C, C++, ReactJs, PHP, jQuery, JSON

Tools: REST Api, POSTMAN, JIRA, GitHub

Databases: MySQL, MSSQL, Vertica, MongoDB, SQLite, PostGreSQL

Employment History

The ep5 Educational Broadcasting Foundation (Internship) | New York, NY July 2023 - Aug 2023

- Addressing the issue to link EtherCAT to contemporary digitalization and enable dynamic control instead of using physical remotes or buttons using C# as the foundational platform for development.
- Put in place a code that allows data to be downloaded from the US Naval Observatory. The goal was to preserve and digitize the data so that statistics could be generated.
- I spent time working on a recipe editor that would use these navy codes to show the sun rising and setting. In addition, it would be utilized to control lighting and temperature changes according to programming parameters.

Potomac Technologies Pvt. Ltd. | Mumbai, India Oct 2020 - Aug 2022

- Working on application-level code that provides mortgage loans to the government workers of US, providing me the opportunity to learn MEAN stack development.
- Additionally, I was responsible for handling a sensitive project related to US government workers, where I resolved issues, worked on SQL procedures, and automated a manual process giving efficiency of more than 95%.
- I implemented data encryption, redaction techniques, and integrated Google AuthFlow for secure authentication and authorization based on tokenization and to enable the PKI certificate based MTLS between services in C#, I implemented a combination of PKI, SSL/TLS protocols and client-server authentication.
- I collaborated with the security compliance team and reported to my Project Manager throughout the process.
- Later, I also developed application-level code in Node.js and learned how to deploy code using Docker.

Plada Infotech Services Pvt. Ltd. | Mumbai, India September 2019 - September 2020

- Developed Java APIs for the organization's ongoing web application for food delivery.
- JavaScript was utilized for AJAX requests, while JSON was used for backend connections and responses.
- Worked together to create an organization website with the UI design team and on-shore clients: <https://blooom.ooo>
- Modeled the API for our food delivery client ShadowFax using Java APIs and MVC frameworks.
- Linked the mainframe application to Google Authenticator and JWT tokens for server authentication.

Curriculum Projects

FruitBot Challenge

- Our group's project for the Artificial Intelligence course was recognized as one of the best games in the program.
- The game consisted of a competing bot created by another online developer and a bot positioned at random on a MxN grid with fruits positioned in various cells.
- The primary goal was to gather as many fruits as possible while avoiding the avaricious practice of following the fruit that was closest in order to maximize points.
- This JavaScript project was primarily implemented through the use of backtracking and the greedy method, two search strategies.
- Our team's bots performed exceptionally well, defeating nearly half of the opponents' bots in the online arena.

8085 Simulator with C Compiler

- During my final year of a bachelor's degree program, I worked on a project where we implemented a simulator that would actually use multi-threading operations to operate an 8085 microprocessor.
- The simulator included all the features and displayed information about the bit operation that was performed, including flag bit usage.
- All the buttons and components were implemented, along with a small GUI to display the outputs.
- In order to increase the capabilities, we created a C compiler that would interpret the opcodes as a component of the instruction and produce a C program that would function as an exact translation between an assembly language and a compiler language.
- Java served as the mainframe language for the implementation of the entire project.

Library Management System

- As part of the minor project for the degree program, we put in place a library management system connected to a XAMPP server local database.
- Originally written in Java, the application included a few standard functions like taking attendance, checking and returning books, forgetting passwords, logging in, and authenticating users through an OTP system that was managed locally by a database.

References

- I can provide references as and when needed.
