SUMMARY

Senior Data Analyst with 7+ years of experience in healthcare analytics, business intelligence, and data-driven decision support across clinical, operational, and supply chain environments. Skilled in translating complex datasets into actionable insights to improve operational performance, reporting accuracy, and business decision-making. Experienced in building scalable analytics solutions, developing KPI frameworks, and leveraging forecasting techniques to support planning and optimization. Strong collaborator with the ability to communicate insights effectively to both technical and business stakeholders.

TECHNICAL SKILLS

- Data Analytics & Programming:** SQL, Python, Pandas, NumPy, Advanced Excel, Exploratory Data Analysis (EDA), Statistical Analysis, Predictive Analytics, Time Series Forecasting, Root-Cause Analysis
- Business Intelligence & Visualization:** Power BI, Tableau, Looker, Dashboard Development, KPI & Metrics Design, Data Visualization, Self-Service Analytics, Executive Reporting, Data Storytelling
- Databases, Cloud & Data Platforms:** Amazon Redshift, Amazon S3, Google BigQuery, Snowflake, AWS, Data Modeling, Dimensional Modeling, Star Schema, Snowflake Schema, Query Optimization
- Data Engineering & Quality:** ETL/ELT, Data Extraction, Data Transformation, Data Integration, Data Validation, Data Reconciliation, Data Quality, Data Governance, Pipeline Monitoring, Git
- AI & Advanced Analytics:** Generative AI, Large Language Models (LLMs), AI-Assisted Analytics, LLM-Assisted SQL & Python, Prompt Engineering, Anomaly Detection, Automated Insight Generation, Predictive Modeling
- Business & Operational Analytics:** KPI Development, Forecasting, Operational Analytics, Supply Chain Analytics, Performance Analytics, Requirements Gathering, Stakeholder Management, Decision Support

WORK EXPERIENCE

Senior Data Analyst | Cardinal Health, USA Jul 2024 – Present

- Analyze large-scale healthcare supply chain, inventory, fulfillment, and operational datasets using advanced SQL and Python to identify demand patterns, cost drivers, service-level trends, and opportunities for operational improvement.
- Develop Python-based demand forecasting and predictive analytics models using historical consumption, seasonality, inventory movements, and operational trends to support demand planning, inventory optimization, and supply availability decisions.
- Build Power BI and Looker dashboards with reusable data models and standardized KPI definitions to monitor inventory, fulfillment, cost, service levels, and operational performance for business and leadership teams.
- Develop complex SQL workflows across Amazon S3 and Amazon Redshift to extract, transform, validate, and analyze high-volume datasets supporting enterprise reporting and analytics initiatives.
- Implement data-quality controls, validation rules, reconciliation logic, and anomaly monitoring across analytical workflows to improve data reliability and identify exceptions affecting operational planning and reporting.
- Apply Generative AI and Large Language Model (LLM)-assisted analytics to accelerate SQL development, exploratory analysis, documentation, root-cause analysis, and insight generation while validating AI outputs against source data and business rules.

BI Analyst | Apollo Healthcare, India Apr 2020 – Apr 2022

- Developed advanced SQL queries and analytical workflows across Electronic Health Record (EHR), clinical, patient, financial, and operational datasets to support healthcare reporting and business intelligence initiatives.
- Designed and maintained Power BI and Tableau dashboards tracking OPD/IPD volumes, bed occupancy, patient wait times, admissions, discharges, revenue, and departmental performance for clinical and administrative leadership.
- Built reusable data models and standardized reporting datasets to consolidate information from multiple healthcare systems, improving consistency across recurring operational and management reports.
- Established KPI definitions, business rules, and reporting logic across clinical and administrative functions, creating standardized performance metrics for hospital operations and executive reporting.
- Automated recurring data preparation and reporting workflows using SQL, Excel, and BI tools, reducing manual data manipulation and improving the timeliness of management reporting.
- Performed data profiling, validation, reconciliation, and root-cause analysis to identify data-quality issues across healthcare reporting pipelines and improve the reliability of analytical outputs.
- Conducted operational and patient analytics to identify trends in patient volumes, resource utilization, service turnaround times, and departmental performance, translating findings into actionable recommendations.
- Partnered with clinical, operations, finance, IT, and compliance stakeholders to gather business requirements, define analytical solutions, and deliver dashboards and insights aligned with organizational priorities.

Data Analyst | Fortis Healthcare, India Jun 2017 – Mar 2020

- Analyzed large-scale Electronic Health Record (EHR) and Hospital Information System (HIS) data using SQL and Python to identify patient flow patterns, utilization trends, operational bottlenecks, and departmental performance across hospital operations.
- Developed Tableau dashboards covering OPD/IPD admissions, bed occupancy, discharge trends, patient wait times, treatment timelines, and departmental KPIs, enabling management teams to monitor operational performance through self-service analytics.
- Built SQL-based data extraction and transformation workflows to consolidate clinical, patient, billing, and operational datasets into standardized reporting structures for recurring hospital analytics.
- Designed dimensional data models and optimized analytical queries in Google BigQuery to support scalable clinical and operational reporting and improve the performance of recurring management reports.
- Performed data profiling, validation, reconciliation, and quality checks across healthcare datasets to identify inconsistencies and improve the accuracy and reliability of operational and clinical reporting.
- Conducted patient-flow and departmental performance analysis to identify service delays, resource utilization patterns, and workflow inefficiencies, translating findings into actionable recommendations for hospital operations teams.
- Established standardized KPI definitions and reporting logic for metrics including patient volumes, bed utilization, admissions, discharges, turnaround times, and departmental performance to improve consistency across management reporting.
- Collaborated with clinical, administrative, finance, and operations stakeholders to gather analytical requirements, investigate data issues, and translate business questions into SQL analyses, dashboards, and data-driven recommendations.

EDUCATION

Master of Science in Computer Science | Campbellsville University, USA Sep 2022- May 2024

CERTIFICATIONS

- Microsoft Certified: Power BI Data Analyst Associate (PL-300)
- Google Data Analytics Professional Certificate
- AWS Certified Data Analytics – Specialty
- Google Cloud Generative AI Fundamentals
