

MANEET SHAH

Maneetshah9190@gmail.com | (201) 419-3022 | Irvine, California

SUMMARY

Motivated and enthusiastic undergraduate student with bachelor's in computer science at the University of California, Irvine, seeking an opportunity to gain hands-on experience, contribute to the UCI community, and develop professional skills. Adept at time management, teamwork, and delivering quality service in a fast-paced environment.

EDUCATION

Bachelor of Computer Science from **University of California, Irvine**.

Expected Graduation: Sept 2027

SKILLS

- **Communication:** Strong verbal and written communication skills, with experience in presentations and teamwork.
- **AI & ML :** TensorFlow/Keras, scikit-learn, Pandas/NumPy, Matplotlib/Seaborn; MinMax scaling, IQR winsorization, stratified validation, ROC-AUC
- **Data & Cloud:** Snowflake (Snowsight, SQL), Semantic Modeling (YAML), Streamlit, Excel
- **Programming:** Python, Java, C/C++, JavaScript, HTML/CSS, R, Assembly, React
- **Tools/Methods:** GitHub, Agile, CI/CD, Pytest, Makefile Figma, Wireframing, Adobe Photoshop/Illustrator
- **Foundations:** Data structures, testing, debugging, problem solving, teamwork
- **Organizational Skills:** Highly organized, able to manage multiple tasks efficiently, and meet deadlines.
- **Problem-Solving:** Capable of analyzing situations and offering practical solutions in a timely manner.
- **Team Collaboration:** Able to work effectively with peers and supervisors in a team-based environment.

WORK EXPERIENCE

Data Analytics Intern - SharkNinja

July 2025-Aug 2025

- Designed a semantic model in Snowflake (Cortex Analyst) over DTC order-line data; defined governed measures (revenue, orders, AOV, units) and time/product/customer dimensions.
- Wrote and validated 18 "golden question" SQL queries; compared Analyst answers to SQL truth and refined synonyms/labels to improve NL→SQL reliability.
- Implemented quick governance (row-access policy) and performed light performance tuning (selective filters, clustering, caching) to meet demo targets.
- Built a Streamlit-in-Snowflake demo that queries Cortex Analyst; recorded a short walkthrough for stakeholders and documented a concise runbook.
- Validated 18/18 questions with $\geq 90\%$ accuracy and $P95 \leq 5s$ on DEV

Intern - AdvaMed Association

June 2024-Aug 2024

- Organized and evaluated the bills and expenditures used.
- Created an algorithm which predicted the expenditure of the company in each department.
- Analyzed the given data and created a link between the given data sets.

Intern - ByPeople Technologies

May 2023-Sept 2023

- Performed manual software testing by using black box, white box and gray box testing.
- Understanding the program and then creating a test sheet based on it was crucial as the whole debugging process depended on it.
- Created a test sheet for Swiggy's Software from its login to placing an order.

PROJECTS

Search Engine Developer – UCI-ICS Search System | Github:<https://github.com/Maneetss/cs-121-Search-Engine>

- Designed and implemented a full-stack search engine from scratch capable of processing and retrieving results over tens of thousands of ICS web pages under strict performance constraints (<300ms/query).
- Built a custom inverted index system stored across multiple on-disk partial indexes, including index flushing, multi-way merge, and term-range partitioning to operate under limited memory.
- Implemented tf-idf ranking, stemming (Porter), and boosted scoring for semantic features (titles, headers, bold terms); added support for phrase queries and multi-term scoring.
- Engineered a disk-backed retrieval component that loads only required posting lists at query time to minimize RAM usage and maximize throughput.
- Added advanced ranking enhancements including duplicate-page detection, optional PageRank/HITS, and 2-gram/3-gram indexing for improved recall and precision.
- Developed a user-facing search interface (console or web) with query parsing, stemming, and ranked-result output by URL.
- Achieved reliable performance under constrained memory models similar to real-world cloud search engine deployments.

IPO Listing Gains (India) — TensorFlow Classifier | GitHub: github.com/Maneetss/IPO-prediction

- Built an end-to-end pipeline to predict whether an IPO lists at a profit using TensorFlow/Keras on Indian IPO data (issue size, QIB/HNI/RII subscriptions, issue price).
- Engineered the binary target, handled outliers with IQR winsorization, scaled features with MinMaxScaler, and created a stratified train/test split.
- Trained a dense neural net (ReLU, Adam, BCE, EarlyStopping) and evaluated with Accuracy, AUC, Precision, Recall; delivered ROC and confusion matrix visuals.
- Operationalized with a predicted CLI, saved model & scaler, Makefile one-command runs, pytest smoke tests, GitHub Actions CI, and a full PROJECT_REPORT.md.
- Results: Test Accuracy ~54.7 %.

Credit Card Fraud Detection – Machine Learning Classifier

- Developed a machine learning pipeline in Python to detect fraudulent credit card transactions using a publicly available Kaggle dataset.
- Performed exploratory data analysis (EDA) and visualized transaction patterns with Matplotlib to identify key fraud indicators.
- Engineered features and strengthened signal for minority (fraud) class to enhance model sensitivity and performance.
- Trained and evaluated multiple classification models (SVM, Random Forest, Logistic Regression, KNN, Gradient Boosting, AdaBoost) using scikit-learn, selecting the best-performing algorithm for deployment.
- Achieved benchmark accuracy (e.g., AdaBoost: ~52% accuracy, ~50% cross-validation score) and compared cross-model results to ensure robust validation.
